# Assembler Library 2 – Reference Manual

## Library II Description.

Library II is a set of Routines wrote in Assembler Language for Atmel AVR Family Microcontrollers to be used with Atmel AVRStudio 4.0 developed by **Author Techonology Corp.** These Routines satisfy a minimum requirement to use an Assembler Language of ease way and reliable form, increasing productivity and offering capabilities to work in group of developers and some manner getting more performance in program code size (less bytes used) and more speed competing direct with more high level Languages like a C.

Library II is composited with CONSTANTS, MACROS, ROUTINES and generic no dependent Hardware routines like MATH, PROTOCOLS and dependent Hardware routines like DISPLAY DRIVERS, EEPROM ACCESS, DATA FLASH, ADCs, DACs.

Author Library II routines use a below schematic of flux of program components. The order of steps must be followed strictly to avoid program unpredictable results.

## Program steps.

Step	Command	Description
1	<code>.INCLUDE "DEFS\GLOBAL_DEFINITIONS\GLOBDEFS.INC"</code>	Must be a first include and always be included
2	<code>.EQU _SRAM_BOOT_TYPE=_SRAM_NOT_CLEAR .EQU _AVR_CLOCK = 16000000</code>	Compiler and Software settings
3	<code>.INCLUDE "DEFS\M64_FILES\M64DEF.INC" .INCLUDE "DEFS\M64FILES\M64HDC.INC"</code>	Processor definitions and handle interrupts
4	<code>----- ;  GRAPH ROUTINES ----- .INCLUDE "GRAPH\LINE\LINE.HUG" .INCLUDE "GRAPH\RASTER\BASE\RASTER_BASE.INC" ----- ;  EEPROM ROUTINES ----- .INCLUDE "EEPROMS\AVRE2P\A256_EX.HUG" ----- ;  PROTOCOL ROUTINES ----- .INCLUDE "PROTOCOL\AUTHOR\DSFRAME\DSFRAME.HUG"</code>	Generic Library II routines, left only a example.

Step	Command	Description
5	<code>.INCLUDE</code>	All Hardware dependent

## Assembler Library 2 – Reference Manual

	<code>"HARDWARE_DEFINITIONS.INC"</code>	routines are placed inside of this file
6	<code>.INCLUDE "LOCAL_DEFINITIONS.INC"</code>	All not Hardware dependent routines are placed inside of this file such as global program Functions, program Modules
7	<code>_MAIN_INIT:</code> <code>call _CPULED_INIT</code> <code>call _MOTION_RELAY_INIT</code>	<code>_MAIN_INIT</code> label must always include and is the first entry point accessed after boot initialization, and here is placed all drives, routines, objects that must be initialized before is used.
8	<code>_MAIN:</code>	Here, after <code>_MAIN:</code> label are placed the Main Program that call all routines placed in <code>Hardware_definition.inc</code> or <code>Local_definition.inc</code> , but if you want to use a OOP techniques Hardware dependent routines must be avoid

# Assembler Library 2 – Reference Manual

---

## Prefixes/Suffixes.

Author Libray II routines use below prefixes and suffixes to facility program scope, program reliability and program clarity.

Prefixes/Suffixes	Description
<b>_</b> (Underscore)	Prefix to signalize that a routine or label is inside a Library Ex: Call _DISP_DATA_WRITE
<b>fn_</b>	Prefix placed at all functions in Local_Definitions.inc file meaning a Function
<b>_MODULE_</b>	Prefix placed at all programs Module routines that use functions defined in Local_Definitions.inc, if an OOP techniques is used all hardware dependent routines must be avoid.
<b>.INC</b>	Suffix placed in file extension meaning generic include file or Library for AVR with less than 8Kbytes of Flash memory
<b>.HUG</b>	Suffix placed in file extension meaning generic include file or Library for AVR with more than 8Kbytes of Flash memory

# Assembler Library 2 – Reference Manual

## Registers.

Author Libray II routines registers use the below definitions.

Register	Description
<b>R0..R15</b>	Usually used as scrap registers otherwise specified.
<b>Acc ,R24</b> <b>AccH,R25</b>	Acc is used like an Accumulator of 8bits size and AccH is an Accumulator High with 8 bits size, both may be used separated or together forming a 16bit register in macros prefixed by AccAW, this register is preferred way to pass and return values from routines Ex: Ldi Acc,23 ; Load Acc with 23 Ldi AccH,18 ; Load AccH with 18 Ldiaw 1234 ; Load AccH:Acc with 1234
<b>AccT ,R16</b> <b>AccTH,R17</b>	AccT is used like a Temporary Accumulator of 8bits size and AccTH is a Temporaty Accumulator High with 8 bits size, both may be used separated or together forming a 16bit register in macros prefixed by AccAWT, this register too is preferred way to pass and return values from routines Ex: Ldi AccT,23 ; Load AccT with 23 Ldi AccTH,18 ; Load AccTH with 18 LdiawT 1234 ; Load AccTH:AccT with 1234
<b>Temp ,R18</b> <b>TempH,R19</b>	Temp is used like a Temporary register of 8bits size and TempH is a Temporaty Register High with 8 bits size, both may be used separated or together forming a 16bit register in macros prefixed by TempH, This register may be used to pass or return values from routines but they use must be used with care. They really a temporary scrap register, long time storage values must be avoid. Ex: Ldi Temp,23 ; Load Temp with 23 Ldi TempH,18 ; Load TempH with 18

# Assembler Library 2 – Reference Manual

---

## Important Files.

Author Library II important files are further explained below.

File	Description
<b>GLOBDEFS.INC</b>	Is a Global Definitions include file that contain a set of Macros, Constants used for all <b>Author programs</b> . And must be always included.
<b>MATHCONS.INC</b>	Is a Global Definitions when a math routine is need, placed on step 4 of program steps.
<b>xxxxDEF.INC</b>	Is a Global Device Definition include file supplied by Atmel AVRStudio 4 generally located at folder \Programs Files\Atmel\AVR Tools\AvrAssembler2\Appnotes Author routines actually support these devices AT90S1200, AT90S2313, AT90S2323, AT90S8515, AT90S8535, ATMEGA8, ATMEGA16, ATMEGA64, ATMEGA128, ATMEGA168 xxxx meaning processor partnumber.
<b>xxxxHDC.INC</b>	<p>Is a Global Device Handle Interrupts include file supplied by <b>Author</b> to possibility a dynamic interrupt handling such as interrupt real time Handle address change and Interrupt cascading allowing that more one Handle routine be used.</p> <p>The control of these handles is taken using below macros.</p> <p><b>_SET_HANDDLE</b> to set a new Handle routine to a specific hardware interrupt.</p> <p><b>_SAVE_HANDDLE</b> to save an actual Handle routine address.</p> <p><b>_CALL_HANDDLE</b> to call a specific hardware interrupt. Author Handle files actually support these devices AT90S1200, AT90S2313, AT90S2323, AT90S8515, AT90S8535, ATMEGA8, ATMEGA16, ATMEGA64, ATMEGA128, ATMEGA168 but take a look at one of these files quickly other devices are made, the only restriction is that file use the formatting <b>xxxxHDC.INC</b> x meaning device partnumber.</p>

## Assembler Library 2 – Reference Manual

File	Description
<b>Hardware_Definitions.Inc</b>	Is a Global Definitions include file that contain all EQUATES, ROUTINES, etc, that is Hardware dependent.
<b>Local_Definitions.Inc</b>	Is a Global Definitions include file that contain all EQUATES,ROUTINES,FUNCTION AND MODULES used by MAIN program and no Hardware dependent routine must called directly by a MODULE if a OOP techniques is used, only FUNCTIONS can call a hardware dependent routine if OOP is used.

## DEFS – Definitions

### GLOBAL DEFINITIONS (GLOBDEFS.INC FILE)

#### Description

A GLOBAL DEFINITIONS include is the first include file in any program of **Author Technology**. This file contains all necessary Constants Equates and General Macros definitions to standardize code, increasing software reliability and turning it clear and reducing time for coding when working in group. **This file must be always included and must be a first include.**

Accumulators registers		
Name	Register	Description
Acc	R24	8bits Accumulator Low
AccH	R25	8bits Accumulator High
AccT	R16	8bits Temporary Accumulator Low
AccTH	R17	8bits Temporary Accumulator High
Temp	R18	8bits used in short time like Temporary low register
TempH	R19	8bits used in short time like Temporary high register
Suffix AW Or AccH:Acc	R25:R24	16bits Accumulator
Suffix AWT Or AccTH:AccT	R17:R16	16bits Temporary Accumulator
Suffix AL Or AccTH:AccT:AccH:AccTH	R17:r16:r25:r24	32bits Accumulator

_ODD	0XFF	255
_NONE	0X00	0
_LEFT	0X01	1
_RIGHT	0X02	2
_UP	0X03	3
_DOWN	0X04	4
_PRESSED	0X05	5
_RELEASED	0X06	6
_TIMEOUT	0X07	7
_YES	0XFF	255
_NO	0X00	0
_OK	0XFF	255
_NOTOK	0X00	0

Global ASCII Codes			
Name	Decimal Value	Hexadecimal Value	meaning
_NULL	0X00	0	Null Char
_BS	0X08	8	Backspace
_TAB	0X09	9	Tab (Tabulation)
_CR	0X0D	13	Carriage Return
_LF	0X0A	10	Line Feed
_NC	0XFF	255	Null Char (special use)
_ASCII_NULL	0X00	0	Null
_ASCII_SOH	0X01	1	Start of Heading
_ASCII_STX	0X02	2	Start of Text
_ASCII_ETX	0X03	3	End of Text
_ASCII_EOT	0X04	4	End of Transmission
_ASCII_ENQ	0X05	5	Enquiry
_ASCII_ACK	0X06	6	Acknowledge
_ASCII_BEL	0X07	7	Bell - Caused teletype machines to ring a bell. Causes a beep
_ASCII_BS	0X08	8	Backspace - Moves the cursor (or print head) move backwards (left)
_ASCII_TAB	0X09	9	Horizontal tab - Moves the cursor (or print head) right to the next
_ASCII_LF	0X0A	10	NL line feed, new line - Moves the cursor (or print head) to a new
_ASCII_VT	0X0B	11	vertical tab
_ASCII_FF	0X0C	12	Form feed - Advances paper to the

			top of the next page
_ASCII_CR	0X0D	13	Carriage return - Moves the cursor all the way to the left
_ASCII_SO	0X0E	14	Shift out - Switches output device to alternate character set.
_ASCII_SI	0X0F	15	shift in - Switches output device back to default character set.
_ASCII_DLE	0X10	16	Data link escape
_ASCII_DC1	0X11	17	Device control 1
_ASCII_DC2	0X12	18	Device control 2
_ASCII_DC3	0X13	19	Device control 3
_ASCII_DC4	0X14	20	Device control 4
_ASCII_NAK	0X15	21	Negative acknowledge
_ASCII_SYN	0X16	22	Synchronous idle
_ASCII_ETB	0X17	23	End of transmission block - Not the same as EOT
_ASCII_CAN	0X18	24	Cancel
_ASCII_EM	0X19	25	End of medium
_ASCII_SUB	0X1A	26	Substitute
_ASCII_ESC	0X1B	27	Escape
_ASCII_FS	0X1C	28	File separator
_ASCII_GS	0X1D	29	Group separator
_ASCII_RS	0X1E	30	Record separator
_ASCII_US	0X1F	31	Unit separator
_ASCII_SPACE	0X20	32	Space
_ASCII_SP	0X20	32	Space
_ASCII_DEL	0X7F	127	Delete

Global Math constants		
Name	Value	Description
_LONG	4	Size of Long variable
_INTEGER	2	Size of Integer variable
_WORD	2	Size of Word variable
_BYTE	1	Size of byte variable

## Assembler Library 2 – Reference Manual

Global character display definitions for HD44780 chip constants		
Name	Value	Description
_DISP_LINE_1	0	1 Row display
_DISP_LINE_2	1	2 Row display
_DISP_FONT_5X8	0	5x8 Font Size
_DISP_FONT_5X10	1	5x10 Font Size
_DISP_4BITS	0	4 bits interface
_DISP_8BITS	1	8 bits interface

Wave constants		
Name	Value	Description
_WAVE_DAC_8	8	8 Bits wave DAC
_WAVE_DAC_16	16	16 Bits wave DAC
_WAVE_DAC_24	24	24 Bits wave DAC
_WAVE_DAC_32	32	32 Bits wave DAC
_WAVE_FS_5500	5500	5500 samples/second
_WAVE_FS_6000	6000	6000 samples/second
_WAVE_FS_8000	8000	8000 samples/second
_WAVE_FS_11025	11025	11025 samples/second
_WAVE_FS_22050	22050	22050 samples/second
_WAVE_FS_32000	32000	32000 samples/second
_WAVE_FS_44100	44100	44100 samples/second
_WAVE_SOURCE_FLASH	1	Wave into AVR Flash
_WAVE_SOURCE_SRAM	2	Wave into AVR SRAM
_WAVE_SOURCE_DEVICE	3	Wave Into DEVICE
_WAVE_STATUS_PLAYING	1	Wave Status playing
_WAVE_STATUS_STOPPED	2	Wave Status Stopped
_WAVE_STATUS_END	3	Wave Status End

Sram boot type constants		
Name	Value	Description
_SRAM_NOT_CLEAR	0	Not clear SRAM during reset
_SRAM_CLEAR	1	Clear SRAM during reset

## Assembler Library 2 – Reference Manual

Prescaler constants for normal AVR chips		
Name	Value	Description
_TIMER_STOP	0B00000000	Timer stop
_TIMER_DIV_1	0B00000001	Timer prescaler divisor by 1
_TIMER_DIV_8	0B00000010	Timer prescaler divisor by 8
_TIMER_DIV_64	0B00000011	Timer prescaler divisor by 64
_TIMER_DIV_256	0B00000100	Timer prescaler divisor by 256
_TIMER_DIV_1024	0B00000101	Timer prescaler divisor by 1024
_TIMER_FALL	0B00000110	Timer Fall
_TIMER_RISE	0B00000111	Timer Rise

Prescaler constants for ATMEGA128 TIMER 0		
Name	Value	Description
_TIMERM0_STOP	0B00000000	Timer stop
_TIMERM0_DIV_1	0B00000001	Timer prescaler divisor by 1
_TIMERM0_DIV_8	0B00000010	Timer prescaler divisor by 8
_TIMERM0_DIV_32	0B00000011	Timer prescaler divisor by 32
_TIMERM0_DIV_64	0B00000100	Timer prescaler divisor by 64
_TIMERM0_DIV_128	0B00000101	Timer prescaler divisor by 128
_TIMERM0_DIV_256	0B00000110	Timer prescaler divisor by 256
_TIMERM0_DIV_1024	0B00000111	Timer prescaler divisor by 1024

Prescaler constants for ATMEGA128 TIMER 2		
Name	Value	Description
_TIMERM2_STOP	0B00000000	Timer stop
_TIMERM2_DIV_1	0B00000001	Timer prescaler divisor by 1
_TIMERM2_DIV_8	0B00000010	Timer prescaler divisor by 8
_TIMERM2_DIV_32	0B00000011	Timer prescaler divisor by 32
_TIMERM2_DIV_256	0B00000100	Timer prescaler divisor by 256
_TIMERM2_DIV_1024	0B00000101	Timer prescaler divisor by 1024
_TIMERM2_FALL	0B00000110	Timer prescaler divisor by FALL
_TIMERM2_RISE	0B00000111	Timer prescaler divisor by RISE

## Assembler Library 2 – Reference Manual

---

Prescaler constants for ATMEGA128 TIMER 1 & 3		
Name	Value	Description
_TIMER13_STOP	0B00000000	Timer stop
_TIMER13_DIV_1	0B00000001	Timer prescaler divisor by 1
_TIMER13_DIV_8	0B00000010	Timer prescaler divisor by 8
_TIMER13_DIV_64	0B00000011	Timer prescaler divisor by 64
_TIMER13_DIV_256	0B00000100	Timer prescaler divisor by 256
_TIMER13_DIV_1024	0B00000101	Timer prescaler divisor by 1024
_TIMER13_FALL	0B00000110	Timer prescaler divisor by FALL
_TIMER13_RISE	0B00000111	Timer prescaler divisor by RISE

Prescaler constants for ATMEGA128 ADC		
Name	Value	Description
_TIMERADC_DIV_2	0B00000000	Timer prescaler divisor by 2
_TIMERADC_DIV_4	0B00000001	Timer prescaler divisor by 4
_TIMERADC_DIV_8	0B00000010	Timer prescaler divisor by 8
_TIMERADC_DIV_16	0B00000011	Timer prescaler divisor by 16
_TIMERADC_DIV_32	0B00000100	Timer prescaler divisor by 32
_TIMERADC_DIV_64	0B00000101	Timer prescaler divisor by 64
_TIMERADC_DIV_128	0B00000110	Timer prescaler divisor by 128

Interrupt pins sensing types constants		
Name	Value	Description
_LOW_LEVEL	0	Level sensing interrupt
_FALLING_EDGE	2	Falling edge sensing interrupt
_RISING_EDGE	3	Rising edge sensing interrupt

Timers Definitions constants		
Name	Value	Description
_TIMER_0	0	To assign reference to timer 0
_TIMER_1	1	To assign reference to timer 1
_TIMER_2	2	To assign reference to timer 2
_TIMER_3	3	To assign reference to timer 3

## Assembler Library 2 – Reference Manual

---

Interrupts Sources definitions constants		
Name	Value	Description
<code>_EXTERNAL_0</code>	0	To assign reference to external interrupt 0
<code>_EXTERNAL_1</code>	1	To assign reference to external interrupt 1
<code>_EXTERNAL_2</code>	2	To assign reference to external interrupt 2
<code>_EXTERNAL_3</code>	3	To assign reference to external interrupt 3
<code>_EXTERNAL_4</code>	4	To assign reference to external interrupt 4
<code>_EXTERNAL_5</code>	5	To assign reference to external interrupt 5
<code>_EXTERNAL_6</code>	6	To assign reference to external interrupt 6
<code>_EXTERNAL_7</code>	7	To assign reference to external interrupt 7

Communications definitions constants		
Name	Value	Description
<code>_COMM0</code>	0	To assign reference to COMM0
<code>_COMM1</code>	1	To assign reference to COMM1
<code>_COMM2</code>	2	To assign reference to COMM2
<code>_COMM3</code>	3	To assign reference to COMM3

MACRO	<code>_SET_HANDLE</code>
Function	Set Handle address routine
Example	Set Timer0 overflow interrupt to jump to ADDRESS_ROUTINE  <code>_SET_HANDLE _HDC_OVF0_VECT,ADDRESS_ROUTINE</code>
Observation	Interrupt are disabled during save and register <b>AccH:Acc</b> is used

## Assembler Library 2 – Reference Manual

---

MACRO	<b>_SAVE_HANDLE</b>
Function	Save Handle address into SRAM
Example	Save Timer0 overflow interrupt address into SRAM_ADDRESS  _SAVE_HANDLE _HDC_OVF0_VECT, SRAM_ADDRESS
Observation	Interrupt are disabled during save and register <b>AccH:Acc</b> is used

MACRO	<b>_CALL_HANDLE</b>
Function	Call Handle routine pointed by SRAM address
Example	Call Timer0 overflow interrupt  _CALL_HANDLE _HDC_OVF0_VECT or _CALL_HANDLE SRAM_ADDRESS
Observation	<b>Z</b> register used to hold a address to be call

MACRO	<b>LDIAW</b>
Function	Load immediate value into <b>AccH:Acc</b>
Example	Load immediate <b>AccH:Acc</b> with 1500  LDIAW 1500

MACRO	<b>LDIAWT</b>
Function	Load immediate value into <b>AccTH:AccT</b>
Example	Load immediate <b>AccTH:AccT</b> with 1500  LDIAWT 1500

MACRO	<b>LDIAL</b>
Function	Load immediate value into <b>AccTH:AccT:AccH:Acc</b>
Example	Load immediate <b>AccTH:AccT:AccH:Acc</b> with 12345000  LDIAL 12345000

## Assembler Library 2 – Reference Manual

MACRO	LDIX
Function	Load immediate value into <b>X</b>
Example	Load immediate <b>X</b> with 1234  LDIX 1234

MACRO	LDIY
Function	Load immediate value into <b>Y</b>
Example	Load immediate <b>Y</b> with 1234  LDIY 1234

MACRO	LDIZ
Function	Load immediate value into <b>Z</b>
Example	Load immediate <b>Z</b> with 1234  LDIZ 1234

MACRO	CLRW
Function	Clear registers <b>X,Y</b> or <b>Z</b>
Example	Clear <b>X,Y</b> and <b>Z</b>  CLRW X CLRW Y CLRW Z

MACRO	LDIW
Function	Load immediate registers <b>X,Y</b> or <b>Z</b>
Example	Load immediate <b>X</b> =123 <b>Y</b> =456 <b>Z</b> =789  LDIW X,123 LDIW Y,456 LDIW Z,789

MACRO	LDSAW
Function	Load 16Bits <b>AccH:Acc</b> with memory contents position
Example	Load <b>AccH:Acc</b> with memory contents SRAM_POS  LDSAW SRAM_POS

MACRO	LDSAWT
-------	--------

## Assembler Library 2 – Reference Manual

<b>Function</b>	Load 16Bits <b>AccTH:AccT</b> with memory contents position
<b>Example</b>	Load <b>AccTH:AccT</b> with memory contents SRAM_POS  LDSAWT SRAM_POS

<b>MACRO</b>	<b>LDSAL</b>
<b>Function</b>	Load 32Bits <b>AccTH:AccT:AccH:Acc</b> with memory contents position
<b>Example</b>	Load <b>AccTH:AccT:AccH:Acc</b> with memory contents of SRAM_POS  LDSAL SRAM_POS

<b>MACRO</b>	<b>LDDAW</b>
<b>Function</b>	Load 16Bits <b>AccH:Acc</b> with using <b>X,Y</b> or <b>Z</b> as base + index
<b>Example</b>	Load <b>AccH:Acc</b> with memory contents pointed by X+2  LDDAW X,2

<b>MACRO</b>	<b>LDDAWT</b>
<b>Function</b>	Load 16Bits <b>AccTH:AccT</b> with using <b>X,Y</b> or <b>Z</b> as base + index
<b>Example</b>	Load <b>AccTH:AccT</b> with memory contents pointed by X+2  LDDAWT X,2

<b>MACRO</b>	<b>LDSW</b>
<b>Function</b>	Load 16Bits <b>X,Y</b> or <b>Z</b> with memory position
<b>Example</b>	Load <b>Z</b> with memory contents position SRAM_POS  LDSW Z,SRAM_POS

## Assembler Library 2 – Reference Manual

---

MACRO	LDDW
Function	Load 16Bits <b>X,Y or Z</b> with using <b>X,Y or Z</b> as base + index
Example	Load <b>Y</b> with memory contents pointed by X+2  LDDW Y,X,2

MACRO	STSAW
Function	Store 16Bits <b>AccH:Acc</b> into memory position
Example	Store <b>AccH:Acc</b> into memory SRAM_POS  STSAW SRAM_POS

MACRO	STSAWT
Function	Store 16Bits <b>AccTH:AccT</b> into memory position
Example	Store <b>AccTH:AccT</b> into memory SRAM_POS  STSAWT SRAM_POS

MACRO	STSAL
Function	Store 32Bits <b>AccTH:AccT:AccH:Acc</b> into memory position
Example	Store <b>AccTH:AccT:AccH:Acc</b> into memory SRAM_POS  STSAL SRAM_POS

MACRO	STSW
Function	Store 16Bits <b>X,Y or Z</b> into memory position
Example	Store <b>Z</b> into memory position SRAM_POS  STSW SRAM_POS,Z

MACRO	ADDI
Function	Add immediate to register
Example	Add immediate value 5 to register Acc  ADDI Acc,5

## Assembler Library 2 – Reference Manual

---

MACRO	ADCI
Function	Add immediate with carry to register
Example	Add immediate with carry value 5 to register Acc  ADCI Acc,5

MACRO	SUBIAW
Function	Subtract 16Bits <b>AccH:Acc</b> with immediate value
Example	Subtract <b>AccH:Acc</b> with 45  SUBIAW 45

MACRO	SUBIAWT
Function	Subtract 16Bits <b>AccTH:AccT</b> with immediate value
Example	Subtract <b>AccTH:AccT</b> with 45  SUBIAWT 45

MACRO	SUBIAL
Function	Subtract 32Bits <b>AccTH:AccT:AccH:Acc</b> with immediate value
Example	Subtract <b>AccTH:AccT:AccH:Acc</b> with 12345678  SUBIAL 12345678

MACRO	ADDIAW
Function	Add 16Bits <b>AccH:Acc</b> with immediate value
Example	Add <b>AccH:Acc</b> with 1234  ADDIAW 1234

MACRO	ADDIAWT
Function	Add 16Bits <b>AccTH:AccT</b> with immediate value
Example	Add <b>AccTH:AccT</b> with 1234  ADDIAWT 1234

## Assembler Library 2 – Reference Manual

---

MACRO	ADDIAL
Function	Add 32Bits <b>AccTH:AccT:AccH:Acc</b> with immediate value
Example	Add <b>AccTH:AccT:AccH:Acc</b> with 12345678  ADDIAL 12345678

MACRO	SUBIW
Function	Subtract 16Bits <b>X,Y</b> or <b>Z</b> with immediate value
Example	Subtract <b>Y</b> with 78  SUBIW Y,78

MACRO	LSRW
Function	Logical shift right word register <b>X,Y,Z</b>
Example	Logical shift right word X  LSRW X

MACRO	ASRW
Function	Arithmetic shift right word register <b>X,Y,Z</b>
Example	Arithmetic shift right word X  ASRW X

MACRO	LSLAW
Function	Logical shift left 16Bits <b>AccH:Acc</b>
Example	Logical shift left <b>AccH:Acc</b>  LSLAW

MACRO	LSLAWT
Function	Logical shift left 16Bits <b>AccTH:AccT</b>
Example	Logical shift left <b>AccTH:AccT</b>  LSLAWT

## Assembler Library 2 – Reference Manual

---

MACRO	LSRAW
Function	Logical shift right 16Bits <b>AccH:Acc</b>
Example	Logical shift right <b>AccH:Acc</b>  LSRAW

MACRO	LSRAWT
Function	Logical shift right 16Bits <b>AccTH:AccT</b>
Example	Logical shift right <b>AccTH:AccT</b>  LSRAWT

MACRO	ASRAW
Function	Arithmetic shift right 16Bits <b>AccH:Acc</b>
Example	Arithmetic shift right <b>AccH:Acc</b>  ASRAW

MACRO	ASRAWT
Function	Arithmetic shift right 16Bits <b>AccTH:AccT</b>
Example	Arithmetic shift right <b>AccTH:AccT</b>  ASRAWT

MACRO	SUBW
Function	Subtract <b>X,Y,Z</b> from <b>X,Y,Z</b>
Example	Subtract <b>X</b> from <b>Z</b>  SUBW <b>X,Z</b>

MACRO	ADDIW
Function	Add <b>X,Y,Z</b> with immediate value
Example	Add <b>Z</b> with 1234  ADDIW Z,1234

## Assembler Library 2 – Reference Manual

MACRO	ADDW
Function	Add <b>X,Y,Z</b> with <b>X,Y,Z</b>
Example	Add <b>X</b> with <b>Z</b>  ADDW <b>X,Z</b>

MACRO	CPIW
Function	Compare <b>X,Y,Z</b> with immediate value
Example	Compare <b>X</b> with 7  CPIW <b>X,7</b>
Observation	<b>Temp</b> destroyed

MACRO	CPW
Function	Compare <b>X,Y,Z</b> with <b>X,Y,Z</b>
Example	Compare <b>X</b> with <b>Z</b>  CPW <b>X,Z</b>

MACRO	CPIAW
Function	Compare 16Bits <b>AccH:Acc</b> with immediate value
Example	Compare 16Bits <b>AccH:Acc</b> with 127  CPIAW 127
Observation	<b>Temp</b> destroyed

MACRO	CPIAL
Function	Compare 32Bits <b>AccTH:AccT:AccH:Acc</b> with immediate value
Example	Compare <b>AccTH:AccT:AccH:Acc</b> with 12345678  CPIAL 12345678
Observation	<b>Temp</b> destroyed

MACRO	PUSHAW
Function	Push into stack 16Bits <b>AccH:Acc</b>
Example	Push <b>AccH:Acc</b>  PUSHAW

MACRO	PUSHAWT
Function	Push into stack 16Bits <b>AccTH:AccT</b>

## Assembler Library 2 – Reference Manual

<b>Example</b>	Push <b>AccTH:AccT</b>  PUSHAWT
----------------	---------------------------------------

<b>MACRO</b>	<b>PUSHTEMPW</b>
<b>Function</b>	Push into stack 16Bits <b>TempH:Temp</b>
<b>Example</b>	Push <b>TempH:Temp</b>  PUSHTEMPW

<b>MACRO</b>	<b>PUSHW</b>
<b>Function</b>	Push into stack 16Bits <b>X,Y,Z</b>
<b>Example</b>	Push <b>Z</b>  PUSHW <b>Z</b>

<b>MACRO</b>	<b>PUSHW</b>
<b>Function</b>	Push into stack 16Bits <b>X,Y,Z</b>
<b>Example</b>	Push <b>Z</b>  PUSHW <b>Z</b>

<b>MACRO</b>	<b>POPAW</b>
<b>Function</b>	Pop from stack 16Bits <b>AccH:Acc</b>
<b>Example</b>	Pop <b>AccH:Acc</b> from stack  POPAW

<b>MACRO</b>	<b>POPAWT</b>
<b>Function</b>	Pop from stack 16Bits <b>AccTH:AccT</b>
<b>Example</b>	Pop <b>AccTH:AccT</b> from stack  POPAWT

## Assembler Library 2 – Reference Manual

---

MACRO	POPTEMPW
Function	Pop from stack 16Bits <b>TempH:Temp</b>
Example	Pop <b>TempH:Temp</b> from stack  POPTEMPW

MACRO	POPW
Function	Pop from stack 16Bits <b>X,Y,Z</b>
Example	Pop <b>Z</b> from stack  POPW Z

MACRO	LBRNE
Function	Long Branch not equal(no limit of +-2k)
Example	Branch to Address if not Equal  LBRNE Address

MACRO	LBREQ
Function	Long Branch equal(no limit of +-2k)
Example	Branch to Address if Equal  LBREQ Address

MACRO	LBRCS
Function	Long Branch if Carry bit Set(no limit of +-2k)
Example	Branch to Address if not CY=1  LBRCS Address

MACRO	LBRCC
Function	Long Branch if Carry bit Clear(no limit of +-2k)
Example	Branch to Address if not CY=0  LBRCC Address

## Assembler Library 2 – Reference Manual

MACRO	<b>LBRLT</b>
<b>Function</b>	Long Branch if less than signed(no limit of +-2k)
<b>Example</b>	Branch to Address if less than  LBRLT Address

MACRO	<b>LBRMI</b>
<b>Function</b>	Long Branch if Minus(no limit of +-2k)
<b>Example</b>	Branch to Address if minus  LBRMI Address

MACRO	<b>LBRPO</b>
<b>Function</b>	Long Branch if Positive(no limit of +-2k)
<b>Example</b>	Branch to Address if Positive  LBRPO Address

MACRO	<b>LBRGE</b>
<b>Function</b>	Long Branch if Great or Igual signed(no limit of +-2k)
<b>Example</b>	Branch to Address if Great or Igual  LBRGE Address

MACRO	<b>LBRSH</b>
<b>Function</b>	Long Branch if Same or High unsigned(no limit of +-2k)
<b>Example</b>	Branch to Address if Same or High  LBRSH Address

MACRO	<b>LBRLO</b>
<b>Function</b>	Long Branch if Lower(no limit of +-2k)
<b>Example</b>	Branch to Address if Lower  LBRLO Address

## Assembler Library 2 – Reference Manual

---

MACRO	<u>M_PUSH_LOWER_REGS</u>
Function	Push into stack registers R0..R15
Example	Pushing registers R0..R15  <u>M_PUSH_LOWER_REGS</u>

MACRO	<u>M_PUSH_UPPER_REGS</u>
Function	Push into stack registers R16..R31
Example	Pushing registers R16..R31  <u>M_PUSH_UPPER_REGS</u>

MACRO	<u>M_PUSH_ALL_REGS</u>
Function	Push into stack registers R0..R31
Example	Pushing registers R0..R31  <u>M_PUSH_ALL_REGS</u>

MACRO	<u>M_POP_LOWER_REGS</u>
Function	Pop from stack registers R0..R15
Example	Poping registers R0..R15  <u>M_POP_LOWER_REGS</u>

MACRO	<u>M_POP_UPPER_REGS</u>
Function	Pop into stack registers R16..R31
Example	Poping registers R16..R31  <u>M_POP_UPPER_REGS</u>

MACRO	<u>M_POP_ALL_REGS</u>
Function	Pop into stack registers R0..R31
Example	Poping registers R0..R31  <u>M_POP_ALL_REGS</u>

## Assembler Library 2 – Reference Manual

### AVR Family chips names definitions and Interrupts Handles for following devices 1200,2313,2323,8515,8535,M8,M16,M64,M128,M162

#### Description

Each AVR Microcontroller device has a lot of internal register, these registers are used to set mode of operation of internal features like USART,PWM,TIMER,GPIO,I2C,ADC etc, to facility use of these register names is assigned to them, the files with this names has the following format XXXXDEF.INC where XXXX is a device number, below a list of Definitions files used by **Author**;

1200DEF.INC  
2313DEF.INC  
8515DEF.INC  
8535DEF.INC  
M8.INC  
M16.INC  
M64.INC  
M128.INC  
M162.INC

Furthermore each device has a interrupt handle file that allow dynamic handling of interrupts like assigned in run time a routine that process this interrupt or cascading then. Below a tables describing handles of each device.

(AT90S2313) 2313HDC.INC HANDLE FILE	
HANDLES	Description
<u>HDC_INT0_VECT</u>	External Interrupt IRQ0
<u>HDC_INT1_VECT</u>	External Interrupt IRQ1
<u>HDC_ICP1_VECT</u>	Timer1 capture interrupt handle
<u>HDC_OC1_VECT</u>	Timer1 compare interrupt handle
<u>HDC_OVF0_VECT</u>	Timer0 Overflow interrupt handle
<u>HDC_URXC_VECT</u>	UART RX complete interrupt handle
<u>HDC_UDRE_VECT</u>	UDR Empty interrupt handle
<u>HDC_UTXC_VECT</u>	UART TX complete interrupt handle
<u>HDC_ACI_VECT</u>	Analog comparator interrupt handle

## Assembler Library 2 – Reference Manual

(AT90S2323) 2323HDC.INC HANDLE FILE	
HANDLES	Description
<code>_HDC_INT0_VECT</code>	External Interrupt IRQ0
<code>_HDC_OVF0_VECT</code>	Timer0 Overflow interrupt handle

(AT90S8515) 8515HDC.INC HANDLE FILE	
HANDLES	Description
<code>_HDC_INT0_VECT</code>	External Interrupt IRQ0
<code>_HDC_INT1_VECT</code>	External Interrupt IRQ1
<code>_HDC_ICP1_VECT</code>	Timer1 capture interrupt handle
<code>_HDC_OC1A_VECT</code>	Timer1 compare math A interrupt handle
<code>_HDC_OC1B_VECT</code>	Timer1 compare math B interrupt handle
<code>_HDC_OVF1_VECT</code>	Timer1 Overflow interrupt handle
<code>_HDC_OVF0_VECT</code>	Timer0 Overflow interrupt handle
<code>_HDC_SPI_VECT</code>	SPI Serial transfer interrupt handle
<code>_HDC_URXC_VECT</code>	UART RX complete interrupt handle
<code>_HDC_UDRE_VECT</code>	UDR Empty interrupt handle
<code>_HDC_UTXC_VECT</code>	UART TX complete interrupt handle
<code>_HDC_ACI_VECT</code>	Analog comparator interrupt handle

(AT90S8535) 8535HDC.INC HANDLE FILE	
HANDLES	Description
<code>_HDC_INT0_VECT</code>	External Interrupt IRQ0
<code>_HDC_INT1_VECT</code>	External Interrupt IRQ1
<code>_HDC_TOC2_VECT</code>	Timer2 compare math interrupt handle
<code>_HDC_OVF2_VECT</code>	Timer2 overflow interrupt handle
<code>_HDC_ICP1_VECT</code>	Timer1 capture interrupt handle
<code>_HDC_OC1A_VECT</code>	Timer1 compare math A interrupt handle
<code>_HDC_OC1B_VECT</code>	Timer0 compare math B interrupt handle
<code>_HDC_OVF1_VECT</code>	Timer1 overflow interrupt handle
<code>_HDC_OVF0_VECT</code>	Timer0 overflow interrupt handle
<code>_HDC_SPI_VECT</code>	SPI serial transfer complete interrupt handle

## MATH DEFINITIONS (MathCons.Inc File)

### Description

Some constants, SRAM variables and register definitions used for math computation using integer or float types. **This must be included if conversion to string is required or use float type variables.**

Double Float Point Memory Formating							
Mantissa						Signal	Exponent
Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7

- Byte 0 - LSB(Less significant Byte)
- Byte 6 - Bit 7 mantissa signal 0 positive 1 negative
- Byte 7 - Exponent - Bit 7 exponent signal 0 positive 1 negative
- 

Double Float Point BCD Memory Formating							
Mantissa						Exponent	
Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	Byte 7
D1-2	D3-4	D5-6	D7-8	D9-10	D11-12	D13-14	E12+ES+ES

- Byte 0 to byte 6 - BCD digits 1 to 14
- Byte 7 - E12 exponent digits 1 and 2
  - Bit 6 exponent signal 0 positive 1 negative
  - Bit 7 mantissa signal 0 positive 1 negative

## Assembler Library 2 – Reference Manual

Global Math constants		
Name	Value	Description
<code>_DF_STR_BUF_SIZE</code>	<code>1+1+16+1+1+2=22</code>	Space used for numeric to string conversions
<code>_FDOUBLE_STACK_SIZE</code>	8 (default)	Default size of float point stack
<code>_FDOUBLE</code>	8	Size of float point double variable
<code>_FSINGLE</code>	4	Size of float point single variable
<code>_FBCD</code>	8	Size of BCD(Binary Codec Decimal) variable
<code>_FSTRING</code>	<code>_DF_STR_BUF_SIZE</code>	Float string numbers
<code>_FBIAS</code>	0X81	Bias used to simplify float point computations
<code>_FPOK</code>	0	Float Point operation Ok
<code>_FEPOVER</code>	1	Float Point error overflow
<code>_FEUNDER</code>	2	Float Point error underflow
<code>_FEDIV0</code>	3	Float point error division by zero
<code>_FEILLEG</code>	4	Float point error illegal operator

Double Float point Operator 1		
Name	Register	Description
<code>_op1_0</code>	R0	1st operator mantissa byte 1
<code>_op1_1</code>	R1	1st operator mantissa byte 2
<code>_op1_2</code>	R2	1st operator mantissa byte 3
<code>_op1_3</code>	R3	1st operator mantissa byte 4
<code>_op1_4</code>	R4	1st operator mantissa byte 5
<code>_op1_5</code>	R5	1st operator mantissa byte 6
<code>_op1_s</code>	R6	1st operator mantissa byte 7 (signal)
<code>_op1_e</code>	R7	1st operator exponent byte 8

## Assembler Library 2 – Reference Manual

Double Float point Operator 2		
Name	Register	Description
_op2_0	R8	2st operator mantissa byte 1
_op2_1	R9	2st operator mantissa byte 2
_op2_2	R10	2st operator mantissa byte 3
_op2_3	R11	2st operator mantissa byte 4
_op2_4	R12	2st operator mantissa byte 5
_op2_5	R13	2st operator mantissa byte 6
_op2_s	R14	2st operator mantissa byte 7 (signal)
_op2_e	R15	2st operator exponent byte 8

Double Float point Accumulator		
Name	Register	Description
_op2_0	R18	2st operator mantissa byte 1 (Temp)
_op2_1	R19	2st operator mantissa byte 2 (TempH)
_op2_2	R20	2st operator mantissa byte 3
_op2_3	R21	2st operator mantissa byte 4
_op2_4	R22	2st operator mantissa byte 5
_op2_5	R23	2st operator mantissa byte 6
_op2_s	R26	2st operator mantissa byte 7 (signal) XL
_op2_e	R27	2st operator exponent byte 8 XH

Double Float Math SRAM Variables		
Name	Size	Description
_DF_MAC	_FDOUBLE	Mantissa accumulator
_DF_P10	_FDOUBLE	Power of 10
_DF_BCD	_FBCD	Float point codec BCD
_IS_SIZE	1	Define string output size of integer conversion.  high nibble integer part size 0..15 low nibble decimal part size 0..15c
_DF_EAC	1	exponent accumulator
_DF_FMASK	1	string flags
_DF_MASK	1	BIT 0=1 + sign for positive numbers  1=1 use thousand separation char 2=1 separation char is (point) else (comma) 3=1 round result 0 no round result
_DF_FS	1	0x00 source is FLASH 0x01 source is SRAM
_DF_FRAC	1	this variable is used to say that FDIV is fractionary when value is 0xff
_DF_FSREG	1	hold a STATUS REGISTER flags of float point comparation

## SRAM INIT (SRAM\_INIT.Inc File)

### Description

During power on, some times are required that all variables in SRAM must be cleared other times not. This include, control when SRAM is cleared of not and initialize normal float point division when MathConst.inc is used.

Use below code to clear SRAM during power on.

```
.EQU _SRAM_BOOT_TYPE = _SRAM_CLEAR
```

Or below code to remainder SRAM state during power on.

```
.EQU _SRAM_BOOT_TYPE = _SRAM_NOT_CLEAR
```

Those above equates must be a first equate in program

# Assembler Library 2 – Reference Manual

## MATH

### DFT – Discrete Fourier Transform

DFT\_8BITS\_64POINTS (DFT864V1.INC File)

#### Description

Discrete Fourier Transform (DFT) has a lot of application in digital signal process like Digital Filters, Frequency Finder, Frequency genlock, wave compress, DTMF recognition, Etc. This routines implements 64 points of DFT means that capable to separate 32 frequencies and get yours amplitudes, working with 8bits of data magnitude with 48db of signal noise ratio. One frequency index of DFT routine is computed using below follow equation:

The DFT for one point frequency is obtained using the next equation

$$v = \left( \sum_{i=0}^{63} dt(i) \cdot \sin\left(\frac{2\pi fi}{64}\right) \right) + \left( \sum_{i=0}^{63} dt(i) \cdot \cos\left(\frac{2\pi fi}{64}\right) \right)$$

Note that correct vectored sum is performed as follow

$$c = \sqrt{a^2 + b^2}$$

but this method is more complex to calculate then to reduce time computation the equation below is used in place.

$$c = |a| + |b|$$

Doing this transformation a imprecision is introduced by a factor of  $\sqrt{2}$  that is soothed by the dynamics of input signal  $dt(i)$  and larger values of output function.

# Assembler Library 2 – Reference Manual

## Implemented Functions

Name	<b><u>_DFT_64B</u></b>
Function	Compute one frequency magnitude using DFT.
Input values	<b>Acc</b> Frequency index 1..32
Output values	<b>AccH:Acc</b> Output frequency power Max value 2030 when signal at 0° Max value 2870 when signal at 45°
Destroy	Flags, R0..R13
Time	Average timing = 5258 clocks 4Mhz 1314us 8Mhz 657us 14.3Mhz 368us
Observations	Procedure to use then routine Fill <b>_DFT_DATA_BUF</b> with 64 data into SRAM at sample frequency FS, after this set <b>Acc</b> with index of frequency to get amplitude into <b>AccH:Acc</b>
Example	Suppose that FS=6000Hz  FIndex0 =FS/64                      <- Min Frequency FIndex31=FIndex0*32              <- Max Frequency FIndex0 = 93.75Hz ... FIndex31=3000.00  Now, if you need to obtain amplitude of Frequency 750Hz.  ldi <b>Acc</b> ,8                      ;FIndex8=int(750/FIndex0) rcall _DDFTB                      ;After this point <b>AccH:Acc</b> ;have a amplitude of index ;frequency

Name	<b><u>_DFT_DATA_CLEAR</u></b>
Function	Clear data in DFB data buffer all igual 0
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Clear all data in DFT buffer  rcall _DFT_DATA_CLEAR call _DFT_DATA_CLEAR (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b><code>_DFT_BUFFER_FILL</code></b>
Function	Check if DFT data buffer is full
Input values	None
Output values	<b>Cy</b> =1 indicating buffer is full
Destroy	Flags
Time	----
Observations	----
Example	<p>Check DFT buffer is full, after this call <b>CY</b>=1 if buffer full.</p> <pre>rcall _DFT_BUFFER_FILL call _DFT_BUFFER_FILL (chips &gt;=16k)</pre>

Name	<b><code>_DFT_DATA_ADD</code></b>
Function	Insert data in DFT data buffer
Input values	<b>Acc</b> data
Output values	<b>Cy</b> =1 indicating buffer is full
Destroy	Flags
Time	----
Observations	----
Example	<p>Insert a new data in DFT data buffer</p> <pre>Ldi  <b>Acc</b>,15 rcall _DFT_DATA_ADD call _DFT_DATA_ADD (chips &gt;=16k)</pre>

# Assembler Library 2 – Reference Manual

## FILTERS

### AVERAGE16 (AVERAGE16.INC File)

#### Description

Average16 circular filter is used to perform a low pass digital filter can be used to remove noise or high frequencies in a signal. Before use this routines set data buffer size as bellow:

```
.EQU _FILTER_AVG16_SIZE = (SIZE)
```

First data buffer is shifted to accommodate a new data value as follow.

$$d(0) = d(1), d(1) = d(2), \dots d(n-1) = d(n), d(n) = data$$

Then the output value of average filter is a average value of below equation

$$dout = \frac{d(0) + d(1) + d(2) + \dots + d(n)}{n}$$

#### Implemented Functions

Name	<b><code>_FILTER_AVG16_SET_VALUE</code></b>
Function	Insert a new value into data buffer
Input values	<b>AccH:Acc</b> value
Output values	None
Destroy	None
Time	----
Observations	----
Example	Set a new value for average computation  Ldiaw 1200 rcall _FILTER_AVG16_SET_VALUE call _FILTER_AVG16_SET_VALUE (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b><code>__FILTER_AVG16_GET_VALUE</code></b>
Function	Get a output value from data buffer
Input values	None
Output values	<b>AccH:Acc</b> value
Destroy	None
Time	----
Observations	----
Example	Get a new value from data buffer, after this <b>AccH:Acc</b> has the value.  <pre>rcall __FILTER_AVG16_GET_VALUE call __FILTER_AVG16_GET_VALUE (chips &gt;=16k)</pre>

Name	<b><code>__FILTER_AVG16_EXECUTE</code></b>
Function	Shift the data buffer and compute new output value
Input values	None
Output values	<b>AccH:Acc</b> value Or use <code>__FILTER_AVG16_GET_VALUE</code>
Destroy	Flags,R0..R12
Time	----
Observations	----
Example	Compute new output value, after this <b>AccH:Acc</b> has the value of <code>call __FILTER_AVG16_GET_VALUE</code>  <pre>rcall __FILTER_AVG16_EXECUTE call __FILTER_AVG16_EXECUTE (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

### FLOAT DOUBLE

### ACOS – ArcCosine (ACOS.INC File)

#### Description

Double float point ArcCosine is calculated using bellow equation.

$$\text{acos}(x) = \frac{\pi}{2} - \text{asin}(x)$$

#### Implemented Functions

Name	<u>DFACOS</u>
Function	Compute Float Double ArcCosine
Input values	Float Acc
Output values	Float Acc Acc Exception code
Destroy	Flags, AccH, R0..R15
Time	----
Observations	----
Example	rcall _DFACOS call _DFACOS (chips >=16k)

## Assembler Library 2 – Reference Manual

---

### ASIN – ArcSine (ASIN.INC File)

#### Description

Double float point ArcSine is calculated using bellow equation.

$$\text{asin}(x) = \text{atan}\left(\frac{x}{\sqrt{1-x^2}}\right)$$

#### Implemented Functions

Name	<b>_DFASIN</b>
Function	Compute Float Double ArcSine
Input values	Float Acc
Output values	Float Acc Acc Exception code
Destroy	Flags, AccH, R0..R15
Time	----
Observations	----
Example	rcall _DFASIN call _DFASIN (chips >=16k)

## Assembler Library 2 – Reference Manual

### ATAN – ArcTangent (ATAN.INC File)

#### Description

Double float point ArcTangent is computed using a `_DFSERATN` that compute a partial arctangent of value in range  $[-\sqrt{2}+1, \sqrt{2}-1]$  then the below equation is used to obtain ArcTangent for full range of values.

$$\text{atan}(x) = \begin{cases} \text{seratn}(x), & \text{if } x < \sqrt{2} - 1 \\ \frac{\pi}{2} - \text{seratn}\left(\frac{1}{x}\right), & \text{if } x > \sqrt{2} + 1 \\ \frac{\pi}{4} + \text{seratn}\left(\frac{x-1}{x+1}\right), & \text{if } \sqrt{2} - 1 < x < \sqrt{x} + 1 \end{cases}$$

#### Implemented Functions

Name	<code>_DFATAN</code>
Function	Compute Float Double ArcTangent
Input values	Float Acc
Output values	Float Acc Acc Exception code
Destroy	Flags, AccH, R0..R15
Time	----
Observations	----
Example	rcall _DFATAN call _DFATAN (chips >=16k)

# Assembler Library 2 – Reference Manual

---

## ADDSUB – Add and Subtraction (DFADDSUB.INC File)

### Description

Double float point Addition and Subtraction.

### Implemented Functions

Name	<u>DFADD</u>
Function	Perform Float Double Addition
Input values	Float Op1 1 <sup>st</sup> operand Float Op2 2 <sup>nd</sup> operand
Output values	Float Acc Acc Exception code
Destroy	Flags, AccH, R0..R15
Time	----
Observations	Perform Float Acc=Float Op1+Float Op2
Example	rcall _DFADD call _DFADD (chips >=16k)

Name	<u>DFSUB</u>
Function	Perform Float Double Subtraction
Input values	Float Op1 1 <sup>st</sup> operand Float Op2 2 <sup>nd</sup> operand
Output values	Float Acc Acc Exception code
Destroy	Flags, AccH, R0..R15
Time	----
Observations	Perform Float Acc=Float Op1-Float Op2
Example	rcall _DFSUB call _DFSUB (chips >=16k)

## Assembler Library 2 – Reference Manual

---

### MULDIV – Multiply and divide (DEFMULDIV.INC File)

#### Description

Double float point Multiply and Divide.

#### Implemented Functions

Name	<b>_DFMUL</b>
Function	Perform Float Double Multiply
Input values	Float Op1 1 <sup>st</sup> operand Float Op2 2 <sup>nd</sup> operand
Output values	Float Acc Acc Exception code
Destroy	Flags, <b>AccH</b> , R0..R15
Time	----
Observations	Perform Float Acc=Float Op1*Float Op2
Example	rcall _DFMUL call _DFMUL (chips >=16k)

Name	<b>_DFDIV</b>
Function	Perform Float Double Divide
Input values	Float Op1 1 <sup>st</sup> operand Float Op2 2 <sup>nd</sup> operand
Output values	Float Acc Acc Exception code
Destroy	Flags, <b>AccH</b> , R0..R15
Time	----
Observations	Perform Float Acc=Float Op1/Float Op2
Example	rcall _DFDIV call _DFDIV (chips >=16k)

# Assembler Library 2 – Reference Manual

---

## DFCPM – Float compare (DEFCPM.INC File)

### Description

Compare two Double float point, after compare status flags will updated according compared values.

### Implemented Functions

Name	<b>_DFCPOP1OP2</b>
Function	Perform Float Double Multiply
Input values	Float Op1 1 <sup>st</sup> operand Float Op2 2 <sup>nd</sup> operand
Output values	Status register _DF_FSREG with the copy of SREG
Destroy	Acc
Time	----
Observations	----
Example	rcall _DFCPOP1OP2 call _DFCPOP1OP2 (chips >=16k)

Below macros may be used to facility branch instruction after compare.

MACRO	<b>_DFJP_EQ</b>
Function	Branch to Address if compare is equal
Example	Jump to Address if Op1=Op2  _DFJP_EQ Address

MACRO	<b>_DFJP_NEQ</b>
Function	Branch to Address if compare is not equal
Example	Jump to Address if Op1<>Op2  _DFJP_NEQ Address

## Assembler Library 2 – Reference Manual

---

MACRO	<b>_DFJP_GT</b>
<b>Function</b>	Branch to Address if Op1>Op2
<b>Example</b>	Jump to Address if Op1>Op2  _DFJP_GT Address

MACRO	<b>_DFJP_LT</b>
<b>Function</b>	Branch to Address if Op1<Op2
<b>Example</b>	Jump to Address if Op1<Op2  _DFJP_LT Address

MACRO	<b>_DFJP_GTEQ</b>
<b>Function</b>	Branch to Address if Op1>=Op2
<b>Example</b>	Jump to Address if Op1>=Op2  _DFJP_GTEQ Address

MACRO	<b>_DFJP_LTEQ</b>
<b>Function</b>	Branch to Address if Op1<=Op2
<b>Example</b>	Jump to Address if Op1<=Op2  _DFJP_LTEQ Address

## Assembler Library 2 – Reference Manual

---

### COSINE (COSINE.INC File)

#### Description

Compute Double float point Cosine using below equation

$$\cos(x) = \sin\left(x + \frac{\pi}{2}\right)$$

#### Implemented Functions

Name	<u>_DFCOS</u>
Function	Perform Float Double Cosine
Input values	Float Acc
Output values	Float Acc Acc exception code
Destroy	Flags,R0..R15,AccH
Time	----
Observations	----
Example	rcall _DFCOS call _DFCOS (chips >=16k)

## Assembler Library 2 – Reference Manual

---

### SINE (SINE.INC File)

#### Description

Compute Double float point Sine using partial sine function `_DFSERSIN` using the below equation:

First reduce value= $x$  to  $2\pi$  arc.

$$x1 = \left| \frac{x}{2\pi} \right|$$

Then compute sine as below

$$\sin(x) = \begin{cases} -\text{ersin}(2\pi - x1), & \text{if } x1 \geq \frac{3\pi}{2} \\ \text{ersin}(x1 - \pi), & \text{if } x1 \geq \pi \\ \text{ersin}(\pi - x1), & \text{if } x1 \geq \frac{\pi}{2} \end{cases}$$

#### Implemented Functions

Name	<code>_DFSIN</code>
Function	Perform Float Double Sine
Input values	Float Acc
Output values	Float Acc Acc exception code
Destroy	Flags,R0..R15,AccH
Time	----
Observations	----
Example	rcall <code>_DFSIN</code> call <code>_DFSIN</code> (chips >=16k)

## Assembler Library 2 – Reference Manual

---

### BCD TO STRING (DFBCDTOS.INC File)

#### Description

Convert `_DF_BCD` SRAM Variable to string scientific formatted.

#### Implemented Functions

Name	<code>_DFBCDTOS</code>
Function	Convert BCD to String scientific formatted
Input values	<code>_DF_BCD</code> SRAM variable
Output values	<code>_DF_STR</code> SRAM variable with string scientific formatted with 0 terminator
Destroy	<code>Flags,R0..R15,Acc,AccH</code>
Time	----
Observations	----
Example	<pre>rcall _DFBCDTOS call _DFBCDTOS (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

---

### FLOAT TO BCD (DFFTOBCD.INC File)

#### Description

Convert float double value in BCD format store in `_DF_BCD` SRAM variable.

#### Implemented Functions

Name	<code>_DFFTOBCD</code>
Function	Convert Float value to BCD
Input values	<code>Float Acc</code>
Output values	<code>_DF_BCD SRAM variable</code>
Destroy	<code>Flags,R0..R15,Acc,AccH</code>
Time	----
Observations	After call this routine you can use <code>_DFBCDTOS</code> to obtain result in string scientific format
Example	<pre>rcall _DFFTOBCD call  _DFFTOBCD (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

---

### FLOAT TO LONG (DFFTOL.INC File)

#### Description

Convert float double value to signed long value 32bits.

#### Implemented Functions

Name	<u>_DFFTOL</u>
Function	Convert Float value to Long
Input values	Float Acc
Output values	AccTH:AccT:AccH:Acc 32bits output value Cy=1 if overflow occur
Destroy	Flags,Float OP1
Time	----
Observations	----
Example	rcall _DFFTOL call _DFFTOL (chips >=16k)

# Assembler Library 2 – Reference Manual

## HEADER MACROS (DOUBLE\_FLOAT\_MACROS.INC File) (DOUBLE\_FLOAT\_HEADER.INC File)

### Description

DOUBLE\_FLOAT\_HEADER is used to load all float point function and DOUBLE\_FLOAT\_HEADER to load all macros to used stacked float point function.

### Implemented Functions

Stack Macros Names	Description
_FINIT	Initialize float point engine
_FDECST	Decrement Float Stack Point
_FINCST	Increment Float Stack Point
_FLD0	Float load 0 into Stack
_FLD1	Float load 1 into Stack
_FLD2	Float load 2 into Stack
_FLDPI2	Float load PI/2 into Stack
_FLDPI4	Float load PI/4 into Stack
_FLDPI	Float load PI into Stack
_FLD3PI2	Float load 3*PI/2 into Stack
_FLD2PI	Float load 2*PI into Stack
_FLDE	Float load e into Stack
_FLDSQRT2	Float load sqrt(2) into stack
_FLDSQRT2M1	Float load sqrt(2)-1 into stack
_FLDSQRT2P1	Float load sqrt(2)+1 into stack
_FLDII X	Float load X integer immediate into stack
_FLDI X	Float load X long integer immediate into stack
_FLDS S	Float load string S in Program Flash into stack
_FLDSS S	Float load string S in SRAM into stack
_FLDB M	Float load M Byte in SRAM into stack
_FLDI M	Float load M Integer in SRAM into stack
_FLDL M	Float load M Long in SRAM into stack
_FLDF M	Float load M single in SRAM into stack
_FLDD M	Float load M double in SRAM into stack
_FLD M	Same as _FLDD
_FSTB M	Float store byte into SRAM M
_FSTI M	Float store integer into SRAM M
_FSTL M	Float store long into SRAM M
_FSTF M	Float store single into SRAM M
_FSTD M	Float store double into SRAM M
_FST M	Same as _FSTD
_FSTBCD M	Float store BCD into SRAM M
_FSTBP M	Float store Byte into SRAM M and pop stack

## Assembler Library 2 – Reference Manual

<code>_FSTIP M</code>	Float store Integer into SRAM M and pop stack
<code>_FSTLP M</code>	Float store Long into SRAM M and pop stack
<code>_FSTFP M</code>	Float store single into SRAM M and pop stack
<code>_FSTDP M</code>	Float store double into SRAM M and pop stack
<code>_FSTP M</code>	Same as <code>_FSTDP</code>
<code>_FSTBCDP M</code>	Float store BCD into SRAM M and pop stack
<code>_FADD</code>	Float addition <code>stack(0)+stack(1)</code> and pop stack
<code>_FSUB</code>	Float addition <code>stack(0)-stack(1)</code> and pop stack
<code>_FMUL</code>	Float addition <code>stack(0)*stack(1)</code> and pop stack
<code>_FDIV</code>	Float addition <code>stack(0)/stack(1)</code> and pop stack
<code>_FDIVFRAC</code>	Float addition <code>stack(0)/stack(1)</code> return fraction part and pop stack
<code>_FINV</code>	Float point reciprocal <code>1/stack(0)</code>
<code>_FABS</code>	Float point absolute of <code>stack(0)</code>
<code>_FCHS</code>	Float point multiply by <code>-1</code> <code>stack(0)</code>
<code>_FSQR</code>	Float point square of <code>stack(0)</code>
<code>_FSQRT</code>	Float point square root of <code>stack(0)</code>
<code>_FINT</code>	Float point integer of <code>stack(0)</code> , round to infinity
<code>_FFIX</code>	Float point integer of <code>stack(0)</code> , round o zero
<code>_FSERSIN</code>	Float point partial sine of <code>stack(0)</code>
<code>_FSERATN</code>	Float point partial arctan of <code>stack(0)</code>
<code>_FSIN</code>	Float point sine of <code>stack(0)</code>
<code>_FCOS</code>	Float point cosine of <code>stack(0)</code>
<code>_FTAN</code>	Float point tangent of <code>stack(0)</code>
<code>_FASIN</code>	Float point arcsine of <code>stack(0)</code>
<code>_FACOS</code>	Float point arccosine of <code>stack(0)</code>
<code>_FCOMP</code>	Float Point compare <code>stack(0)</code> with <code>stack(1)</code>
<code>_FBRANCH_EQ</code>	Fload Point branch if equal
<code>_FBRANCH_NEQ</code>	Fload Point branch if not equal
<code>_FBRANCH_GT</code>	Fload Point branch if Great than
<code>_FBRANCH_LT</code>	Fload Point branch if less than
<code>_FBRANCH_GTEQ</code>	Fload Point branch if great than of equal
<code>_FBRANCH_LTEQ</code>	Fload Point branch if less than or equal

## INFINIT RESULT (DFINF.INC File)

### Description

Set infinities results.

### Implemented Functions

Name	<code>_DFUNDER</code>
Function	Load float <code>Acc</code> with 0 and set underflow code
Input values	<code>None</code>
Output values	<code>Acc</code> underflow code <code>Float Acc</code> 0
Destroy	<code>Flags</code>
Time	----
Observations	----
Example	<code>rcall _DFUNDER</code> <code>call _DFUNDER (chips &gt;=16k)</code>

Name	<code>_DFOVER</code>
Function	Load float <code>Acc</code> with $\pm 1.701412e+38$ and set overflow code
Input values	<code>None</code>
Output values	<code>Acc</code> overflow code <code>Float Acc</code> $\pm 1.701412e+38$
Destroy	<code>Flags</code>
Time	----
Observations	----
Example	<code>rcall _DFOVER</code> <code>call _DFOVER (chips &gt;=16k)</code>

Name	<code>_DFDIV0</code>
Function	Load float <code>Acc</code> with max positive or negative $\pm 1.701412e+38$ and set overflow code
Input values	<code>Float Acc</code>
Output values	<code>Acc</code> overflow code <code>Float Acc</code> $\pm 1.701412e+38$
Destroy	<code>Flags</code>
Time	----
Observations	----
Example	<code>rcall _DFDIV0</code> <code>call _DFDIV0 (chips &gt;=16k)</code>

# Assembler Library 2 – Reference Manual

## INT (INT.INC File)

### Description

Get integer part of float double value. Below examples of returned value for INT and FIX functions.

```
INT(-8.4)=-9
INT(-7)=-7
INT(5.45)=5
INT(9.9)=9
FIX(-6.5)=-6
FIX(6.5)=6
```

### Implemented Functions

Name	<b>_DFINT</b>
Function	Float point get integer part
Input values	Float Acc
Output values	Float Acc Acc exception code
Destroy	Flags
Time	----
Observations	----
Example	rcall _DFINT call _DFINT (chips >=16k)

Name	<b>_DFFIX</b>
Function	Float point get integer part
Input values	Float Acc
Output values	Float Acc Acc exception code
Destroy	Flags
Time	----
Observations	----
Example	rcall _DFFIX call _DFFIX (chips >=16k)

# Assembler Library 2 – Reference Manual

---

## LOAD STORE (DFLDXSTX.INC File)

### Description

Functions to Load Constants and Load/Store Floats **Op1,Op1, Acc** into SRAM.

### Implemented Functions

Name	<b>_DFLD0</b>
Function	Float point load zero into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =0</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLD0 call _DFLD0 (chips >=16k)

Name	<b>_DFLD1</b>
Function	Float point load one(1) into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =1</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLD1 call _DFLD1 (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFLD2</b>
Function	Float point load two(2) into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =2</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLD2 call _DFLD2 (chips >=16k)

Name	<b>_DFLD10</b>
Function	Float point load 10 into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =10</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLD10 call _DFLD10 (chips >=16k)

Name	<b>_DFLDE</b>
Function	Float point load e=2,71828182845904524 into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =2,71828182845904524</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDE call _DFLDE (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFLDSQRT2</b>
Function	Float point load $\sqrt{2}=1,414213562373$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =1,414213562373</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDSQRT2 call _DFLDSQRT2 (chips >=16k)

Name	<b>_DFLDSQRT2M1</b>
Function	Float point load $\sqrt{2}-1=0,414213562373$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =0,414213562373</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDSQRT2M1 call _DFLDSQRT2M1 (chips >=16k)

Name	<b>_DFLDSQRT2P1</b>
Function	Float point load $\sqrt{2}+1=2,414213562373$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =2,414213562373</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDSQRT2P1 call _DFLDSQRT2P1 (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFLDPI2</b>
Function	Float point load $\pi/2=1,5707963267948966$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =1,5707963267948966</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDPI2 call _DFLDPI2 (chips >=16k)

Name	<b>_DFLDPI4</b>
Function	Float point load $\pi/4=0,7853981633974483$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =0,7853981633974483</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDPI4 call _DFLDPI4 (chips >=16k)

Name	<b>_DFLDPI</b>
Function	Float point load $\pi=3,14159265358979324$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =3,14159265358979324</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLDPI call _DFLDPI (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFLD3PI2</b>
Function	Float point load $3\pi/2=4,71238898038468985$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =4,71238898038468985</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLD3PI2 call _DFLD3PI2 (chips >=16k)

Name	<b>_DFLD2PI</b>
Function	Float point load $2\pi=6,28318530717958648$ into <b>Float Acc</b>
Input values	None
Output values	<b>Float Acc =6,28318530717958648</b> <b>Acc FPOK</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLD2PI call _DFLD2PI (chips >=16k)

Name	<b>_DFLDZ</b>
Function	Load <b>Float Acc</b> pointed by Z register
Input values	Z → Float Point in SRAM
Output values	<b>Float Acc</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	Load <b>Float Acc</b> with value_sram  Ldiw   Z,value_sram rcall _DFLDZ call _DFLDZ (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFLDDC</b>
Function	Load <b>Float Acc</b> pointed by Z register into Flash
Input values	Z → Float Point in FLASH
Output values	<b>Float Acc</b>
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	Load <b>Float Acc</b> with value_flash  Ldiw   Z,value_flash*2 rcall  _DFLDDC call   _DFLDDC (chips >=16k)

Name	<b>_DFSTZ</b>
Function	Store <b>Float Acc</b> pointed by Z register
Input values	Z → Float Point in SRAM <b>Float Acc</b> value
Output values	---
Destroy	<b>Flags,Z</b>
Time	----
Observations	----
Example	Store <b>Float Acc</b> into value_sram  Ldiw   Z,value_sram rcall  _DFSTZ call   _DFSTZ (chips >=16k)

Name	<b>_DFLDOP1Z</b>
Function	Load <b>Float Op1</b> pointed by Z register
Input values	Z → Float Point in SRAM
Output values	<b>Float Op1</b>
Destroy	<b>Flags,Z</b>
Time	----
Observations	----
Example	Load <b>Float Op1</b> from value_sram  Ldiw   Z,value_sram rcall  _DFLDOP1Z call   _DFLDOP1Z (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFLDOP2Z</b>
Function	Load <b>Float Op2</b> pointed by Z register
Input values	Z → Float Point in SRAM
Output values	<b>Float Op2</b>
Destroy	<b>Flags,Z</b>
Time	----
Observations	----
Example	Load <b>Float Op2</b> from value_sram  Ldiw    Z,value_sram rcall _DFLDOP2Z call    _DFLDOP2Z (chips >=16k)

Name	<b>_DFACCOPI</b>
Function	Copy <b>Float Acc</b> to <b>Float Op1</b>
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	Move <b>Float Acc</b> To <b>Float Op1</b>  rcall _DFACCOPI call    _DFACCOPI (chips >=16k)

Name	<b>_DFOP1ACC</b>
Function	Copy <b>Float Op1</b> to <b>Float Acc</b>
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	Move <b>Float Op1</b> To <b>Float Acc</b>  rcall _DFOP1ACC call    _DFOP1ACC (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFACCOP2</b>
Function	Copy <b>Float Acc</b> to <b>Float Op2</b>
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	Move <b>Float Acc</b> To <b>Float Op2</b>  rcall _DFACCOP2 call _DFACCOP2 (chips >=16k)

Name	<b>_DFOP2ACC</b>
Function	Copy <b>Float Op2</b> to <b>Float Acc</b>
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	Move <b>Float Op2</b> To <b>Float Acc</b>  rcall _DFOP2ACC call _DFOP2ACC (chips >=16k)

MACRO	<b>_DFPUSHACC</b>
Function	Push <b>Float Acc</b> into Stack pointer
Example	_DFPUSHACC

MACRO	<b>_DFPOPACC</b>
Function	Pop <b>Float Acc</b> From Stack pointer
Example	_DFPOPACC

MACRO	<b>_DFPUSHOP1</b>
Function	Push <b>Float Op1</b> into Stack pointer
Example	_DFPUSHOP1

MACRO	<b>_DFPOPOP1</b>
Function	Pop <b>Float Op1</b> From Stack pointer
Example	_DFPOPOP1

## LONG TO FLOAT (DFLTOF.INC File)

### Description

Convert integer quantities byte, word or long to double float point.

### Implemented Functions

Name	<b>_DFLTOF</b>
Function	Convert long signed 32bits value to double float point
Input values	<b>AccTH:AccT:AccH:Acc</b> long value 32 bits
Output values	<b>Float Acc</b> <b>Acc</b> exception code
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLTOF call _DFLTOF (chips >=16k)

Name	<b>_DFITOF</b>
Function	Convert Integer signed 16bits value to double float point
Input values	<b>AccH:Acc</b> integer value 16 bits
Output values	<b>Float Acc</b> <b>Acc</b> exception code
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFITOF call _DFITOF (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DFATOF OR _DFBTOF</b>
Function	Convert Byte signed 8bits value to double float point
Input values	<b>Acc</b> 8bits value
Output values	<b>Float Acc</b> <b>Acc</b> exception code
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	rcall _DFLTOF call _DFLTOF (chips >=16k)

## SERIES

### ATN – ArcTangent series (SERIE\_ATN.INC File)

#### Description

Compute a partial ArcTangent function using Taylor serie describe below. The range of value of this function is  $[-\sqrt{2}+1, \sqrt{2}+1]$ , values out this range lost precision.

A original Taylor series for ArcTangent follow:

$$\text{atan}(x) = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \frac{x^9}{9} - \frac{x^{11}}{11} \dots$$

But because speed reason the equation is rewritten as following

$$sq = x^2$$

$$v1 = \left( \left( \left( (p4 \cdot sq + p3) \cdot sq + p2 \right) \cdot sq + p1 \right) \cdot sq + p0 \right)$$

$$v2 = \frac{v1}{\left( \left( \left( (sq + q4) \cdot sq + q3 \right) \cdot sq + q2 \right) \cdot sq + q1 \right) \cdot sq + q0}$$

$$\text{atan}(x) = v2 \cdot x$$

*numerador coefficients*

$p4 = 16,1536412982230228262$

$p3 = 268,42548195503973794141$

$p2 = 1153,0293515404850115428136$

$p1 = 1780,40631643319697105464587$

$p0 = 896,78597403663861959987488$

*quotient coefficients*

## Assembler Library 2 – Reference Manual

$q4 = 58,95697050844462222791$   
 $q3 = 536,265374031215315104235$   
 $q2 = 1666,7838148816337184521798$   
 $q1 = 2079,33497444540981287275926$   
 $q0 = 896,78597403663861962481162$

*coefficients are #5077 from Hart & Cheney. (19.56D)*

### Implemented Functions

Name	<code>_DFSERATN</code>
Function	Compute Partial ArcTangent
Input values	<code>Float Acc</code>
Output values	<code>Float Acc</code> <code>Acc</code> exception code
Destroy	<code>Flags, r0..r15, AccH</code>
Time	----
Observations	----
Example	<code>rcall _DFSERATN</code> <code>call _DFSERATN (chips &gt;=16k)</code>

# Assembler Library 2 – Reference Manual

## LN – Natural Logarithm (SERIE\_LN.INC File)

### Description

Compute a partial natural logarithm function using Maclaurin series describe below. The range of value of this function is [1,2], values out this range lost precision.

Modified Maclaurin series for more fast conversion of results of natural logarithm follow:

$$\ln\left(\frac{x-1}{x+1}\right) = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \frac{x^9}{9} + \frac{x^{11}}{11} \dots\right)$$

But to obtain more fast algorithm the equation is rewritten as following

$$\ln\left(\frac{x-1}{x+1}\right) = 2.x(1 + x^2(\frac{1}{3} + x^2(\frac{1}{5} + x^2(\frac{1}{7} + x^2(\frac{1}{9} + x^2(\dots$$

### Implemented Functions

Name	<u>DFSERATN</u>
Function	Compute Partial Natural Logarithm
Input values	Float Acc
Output values	Float Acc Acc exception code
Destroy	Flags,r0..r15,AccH
Time	----
Observations	----
Example	rcall _DFSERLN call _DFSERLN (chips >=16k)

# Assembler Library 2 – Reference Manual

## **SERIE SINE (SERIE\_SINE.INC File)**

### **Description**

Compute a partial Sine function using Maclaurin series describe below. The range of value of this function is  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ , values out this range lost precision.

A original Maclaurin series for sine follow:

$$\sin(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \frac{x^9}{9!} - \frac{x^{11}}{11!} \dots$$

But to obtain more fast algorithm equation is rewritten as following

$$\sin(x) = x(1 + x^2(\frac{1}{3!} + x^2(\frac{1}{5!} + x^2(\frac{1}{7!} + x^2(\frac{1}{9!} + x^2(\dots$$

### **Implemented Functions**

Name	<u>DFSERATN</u>
Function	Compute Partial Sine
Input values	Float Acc
Output values	Float Acc Acc exception code
Destroy	Flags, r0..r15, AccH
Time	----
Observations	----
Example	rcall _DFSERSIN call _DFSERSIN (chips >=16k)

# Assembler Library 2 – Reference Manual

## SQUARE ROOT (DFSQRT.INC File)

### Description

Compute a square root function using Newton/Raphson approximation algorithm.

Let  $x_0 = x$  is my first approximation, then

$$x_{n+1} = \frac{\left(\frac{x}{x_n} + x_n\right)}{2}$$

Repeat above operation until  $x_{x+1} = x_n$ , in that instant  $x_{n+1}$  is equal to square root of  $x$ .

Others considerations, the value  $x$  stored in memory use a base 2 using the following format.

$x = m_x \cdot 2^{E_x}$  where  $m_x$  is the mantissa of  $x$  and  $E_x$  is the exponent of  $x$  base 2. This well known, the below simplification occurs.

$$\sqrt{x} \rightarrow \sqrt{m_x \cdot 2^{E_x}} \rightarrow \sqrt{m_x} \cdot \sqrt{2^{E_x}}$$

When  $E_x$  is even then

$$\sqrt{x} = \sqrt{m_x} \cdot 2^{\frac{E_x}{2}}$$

When  $E_x$  is odd then

$$\sqrt{x} = \sqrt{m_x} \cdot 2^{\frac{E_x-1}{2}} \cdot \sqrt{2}$$

How the base is 2 de maximum value for de  $m_x$  is 2, the number of interaction of Newton/Raphson approximation is 6 for a 16 decimal digits number found experimentally.

## Assembler Library 2 – Reference Manual

---

### Implemented Functions

Name	<code>_DFSQRT</code>
Function	Compute Square root
Input values	<code>Float Acc</code>
Output values	<code>Float Acc</code> <code>Acc</code> exception code
Destroy	<code>Flags,r0..r15,AccH</code>
Time	----
Observations	----
Example	<code>rcall _DFSQRT</code> <code>call _DFSQRT (chips &gt;=16k)</code>

# Assembler Library 2 – Reference Manual

## STRING TO FLOAT (DFSTOF.INC File)

### Description

Convert a String number in ASCII format store in SRAM or FLASH to float double value. The string must be zero ended \0.

### Implemented Functions

Name	<b>_DFSSTOF</b>
Function	Convert a string number in SRAM to float double value
Input values	<b>Z</b> -> String into SRAM
Output values	<b>Float Acc</b> <b>Acc</b> exception code
Destroy	<b>Flags,r0..r15,AccH</b>
Time	----
Observations	----
Example	Convert sram_string_value to float point  Ldiw Z,sram_string_value rcall _DFSSTOF call _DFSSTOF (chips >=16k)

Name	<b>_DFSTOF</b>
Function	Convert a string number in FLASH to float double value
Input values	<b>Z</b> -> String into SRAM
Output values	<b>Float Acc</b> <b>Acc</b> exception code
Destroy	<b>Flags,r0..r15,AccH</b>
Time	----
Observations	----
Example	Convert flash_string_value to float point  Ldiw Z,flash_string_value*2 rcall _DFSTOF call _DFSTOF (chips >=16k)

## Assembler Library 2 – Reference Manual

### TAN - Tangent (TAN.INC File)

#### Description

Compute a Tangent of float double value. Using the follow equation:

$$\tan(x) = \frac{\sin(x)}{\cos(x)}$$

#### Implemented Functions

Name	<b>_DFSSTOF</b>
Function	<i>Compute Tangent</i>
Input values	<i>Float Acc</i> input value
Output values	<i>Float Acc</i> <i>Acc</i> exception code
Destroy	<i>Flags, r0..r15, AccH</i>
Time	----
Observations	----
Example	<i>rcall _DFTAN</i> <i>call _DFTAN (chips &gt;=16k)</i>

# Assembler Library 2 – Reference Manual

## UNARY (UNARY.INC File)

### Description

Perform float double function that use one operator.

### Implemented Functions

Name	<b>_DFABS</b>
Function	Float double absolute
Input values	Float Acc input value
Output values	Float Acc =0 Acc FPOK
Destroy	Flags
Time	----
Observations	----
Example	rcall _DFABS call _DFABS (chips >=16k)

Name	<b>_DFCHS</b>
Function	Float double change sign
Input values	Float Acc input value
Output values	Float Acc =0 Acc FPOK
Destroy	Flags
Time	----
Observations	----
Example	rcall _DFCHS call _DFCHS (chips >=16k)

Name	<b>_DFINV</b>
Function	Float double reciprocal value 1/x
Input values	Float Acc input value
Output values	Float Acc =0 Acc FPOK
Destroy	Flags
Time	----
Observations	----
Example	rcall _DFINV call _DFINV (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b>_DFSQR</b>
Function	Float double square
Input values	Float Acc input value
Output values	Float Acc =0 Acc FPOK
Destroy	Flags
Time	----
Observations	----
Example	rcall _DFSQR call _DFSQR (chips >=16k)

# Assembler Library 2 – Reference Manual

---

## INTEGER

### ATOS (ATOS.INC File)

#### Description

Convert signed byte to string ASCII with fixed size 4 chars and with left zero removal with 0 terminator \0.

#### Implemented Functions

Name	<i><u>ATOS</u> or <u>BTOS</u></i>
Function	Convert signed byte to ASCII string
Input values	<b>Acc</b> signed input value
Output values	<b>z</b> → output string \0
Destroy	Flags
Time	----
Observations	
Example	Convert Acc=45 to String  Ldi <b>Acc</b> , 45 Rcall <u>ATOS</u> Call <u>ATOS</u>

# Assembler Library 2 – Reference Manual

---

## CHECKSUM16 (CHECKSUM16.INC File)

### Description

Compute 16 string of data pointed by z register. May be used to compute IP checksum.

### Implemented Functions

Name	<u>CHECKSUM16</u>
Function	Convert signed byte to ASCII string
Input values	<b>AccH:Acc</b> number of words of string <b>Z-&gt;</b> data in SRAM
Output values	<b>AccH:Acc</b> checksum
Destroy	Flags
Time	----
Observations	if user use this routine only for check purpose the return value must be 0xffff but if used to compute new checksum field the returned value must be complemented using 1 complement
Example	Compute checksum of string_SRAM of 100 words  Ldiw Z,string_SRAM Ldiaw 100 Rcall _CHECKSUM16 Call _CHECKSUM16 (chips>=16k)

# Assembler Library 2 – Reference Manual

## DIV\_S32S32S32 (DIV\_S32S32S32.INC File)

### Description

Divide signed 32bits by signed 32bits and remainder quotient of 32bits and rest 32bits.

### Implemented Functions

Name	<i><u>DIV_S32S32S32</u></i>
Function	Divide signed 32bits by 32bits and remainder quotient of 32bits and rest of 32bits
Input values	<b>R3:R2:R1:R0</b> Dividend <b>R7:R6:R5:R4</b> Divisor
Output values	<b>R3:R2:R1:R0</b> Quotient <b>R8:R9:R10:R11</b> Rest
Destroy	Flags
Time	Min=566 Max=662 clocks
Observations	---
Example	Divide 100000 by 456  Ldial 100000 Mov r0, <b>Acc</b> Mov r1, <b>AccH</b> Mov r2, <b>AccT</b> Mov r3, <b>AccTH</b> Ldial 456 Mov r4, <b>Acc</b> Mov r5, <b>AccH</b> Mov r6, <b>AccT</b> Mov r7, <b>AccTH</b>  rcall <u>DIV_S32S32S32</u> Call <u>DIV_S32S32S32</u> (chips>=16k)

## Assembler Library 2 – Reference Manual

### DIV\_U8U8U8 (DIV\_U8U8U8.INC File)

#### Description

Divide unsigned 8bits by unsigned 8bits result unsigned 8bits.

#### Implemented Functions

Name	<code>_DIV_U8U8U8</code>
Function	Divide unsigned 8bits by unsigned 8bits result unsigned 8bits
Input values	<code>R0</code> Dividend <code>R1</code> Divisor
Output values	<code>R0</code> Quotient <code>R2</code> Rest
Destroy	Flags
Time	Min=77 Max=77 clocks
Observations	---
Example	Divide 100 by 7  Ldi <code>Acc</code> ,100 Mov r0, <code>Acc</code> Ldi <code>Acc</code> ,7 Mov <code>r1</code> , <code>Acc</code>  rcall <code>_DIV_U8U8U8</code> Call <code>_DIV_U8U8U8</code> (chips>=16k)

## Assembler Library 2 – Reference Manual

---

### DIV\_U16U16U16 (DIV\_U16U16U16.INC File)

#### Description

Divide unsigned 16bits by unsigned 16bits result unsigned 16bits.

#### Implemented Functions

Name	<u>DIV_U16U16U16</u>
Function	Divide unsigned 16bits by unsigned 16bits result unsigned 16bits
Input values	<b>R1:R0</b> Dividend <b>R3:R2</b> Divisor
Output values	<b>R1:R0</b> Quotient <b>R5:R4</b> Rest
Destroy	Flags
Time	Min=192 Max=208 clocks
Observations	---
Example	Divide 1000 by 37  Ldiaw 1000 Mov r0, <b>Acc</b> Mov r1, <b>AccH</b> Ldiaw <b>37</b> Mov r2, <b>Acc</b> Mov r3, <b>AccH</b>  rcall _DIV_U16U16U16 Call _DIV_U16U16U16 (chips>=16k)

## Assembler Library 2 – Reference Manual

### DIV\_U16U16U16F16 (DIV\_U16U16U16F16.INC File)

#### Description

Divide unsigned 16bits by unsigned 16 bits result unsigned 16bit integer part and 16bits fraction part.

#### Implemented Functions

Name	<u>_DIV_U16U16U16F16</u>
Function	Divide unsigned 16bits by unsigned 16bits result unsigned 16bits and fractional part 16bits
Input values	<b>R1:R0</b> Dividend <b>R3:R2</b> Divisor
Output values	<b>R1:R0</b> Quotient fraction part <b>R3:R2</b> Quotient integer part
Destroy	Flags
Time	Min=451 Max=484 clocks
Observations	---
Example	Divide 1000 by 37  Ldiaw 1000 Mov r0, <b>Acc</b> Mov r1, <b>AccH</b> Ldiaw <b>37</b> Mov r2, <b>Acc</b> Mov r3, <b>AccH</b>  rcall _DIV_U16U16U16F16 Call _DIV_U16U16U16F16 (chips>=16k)

## Assembler Library 2 – Reference Manual

### DIV\_U32U32U32 (DIV\_U32U32U32.INC File)

#### Description

Divide unsigned 32bits by unsigned 32 bits result unsigned 32bits.

#### Implemented Functions

Name	<i><b>_DIV_U32U32U32</b></i>
Function	Divide unsigned 32bits by unsigned 32bits result unsigned 32bits
Input values	<b>R3:R2:R1:R0</b> Dividend <b>R7:R6:R5:R4</b> Divisor
Output values	<b>R3:R2:R1:R0</b> Quotient <b>R11:R10:R9:R8</b> Rest
Destroy	Flags
Time	Min=566 Max=662 clocks
Observations	---
Example	Divide 100000 by 456  Ldial 100000 Mov r0, <b>Acc</b> Mov r1, <b>AccH</b> Mov r2, <b>AccT</b> Mov r3, <b>AccTH</b> Ldial 456 Mov r4, <b>Acc</b> Mov r5, <b>AccH</b> Mov r6, <b>AccT</b> Mov r7, <b>AccTH</b>  rcall _DIV_U32U32U32 Call _DIV_U32U32U32 (chips>=16k)

# Assembler Library 2 – Reference Manual

## DUMPHEX (DUMPHEX.INC File)

### Description

Convert byte to ASCII two(2) digits hexadecimal value.

### Implemented Functions

Name	<u>DUMPHEX</u>
Function	Convert byte to STRING ASCII hexadecimal
Input values	<b>Acc</b> input value <b>Z</b> -> SRAM area to receive hex ASCII value
Output values	<b>Z</b> -> SRAM after 2 bytes (2 hex digits)
Destroy	Flags
Time	---
Observations	---
Example	Convert 100 to hex  Ldi Acc,100 rcall _DUMPHEX Call _DUMPHEX (chips>=16k) Result "64" in SRAM

Name	<u>TOHEX2</u>
Function	Same as _DUMPHEX but zero ended \0
Input values	<b>Acc</b> input value
Output values	<b>Z</b> -> SRAM area that receive hex ascii digits
Destroy	Flags
Time	---
Observations	---
Example	Convert 100 to hex  Ldi <b>Acc</b> ,100 rcall _TOHEX2 Call _TOHEX2 (chips>=16k) Result "64" in SRAM pointed by <b>Z</b>

## Assembler Library 2 – Reference Manual

### INT\_ATN (INT\_ATN.INC File)

#### Description

Compute integer ArcTangent (X/Y) .

#### Implemented Functions

Name	<u>INT_ATN_XY</u>
Function	Compute integer ArcTangent (X/Y) .
Input values	<b>X</b> 1 <sup>st</sup> value <b>Y</b> 2 <sup>nd</sup> value
Output values	<b>AccH:Acc</b> angle range -90..90 degrees
Destroy	Flags
Time	---
Observations	---
Example	Get Integer arctangent between 100 and 45  Ldiw X,100 Ldiw Y,45 rcall _INT_ATN_XY Call _INT_ATN_XY (chips>=16k)

## Assembler Library 2 – Reference Manual

### INT\_ATN2PTS (INT\_ATN2PTS.INC File)

#### Description

Compute integer ArcTangent between two points p1(x,y) and p2(X/Y).

#### Implemented Functions

Name	<u>INT_ATN2PTS</u>
Function	Compute integer arctangent between two points p1(x,y) and p2(x,y)
Input values	<b>AccH:Acc, AccTH:AccT</b> p1(x,y) <b>X,Y</b> p2(x,y)
Output values	<b>AccH:Acc</b> angle range 0..359 in degrees
Destroy	Flags
Time	---
Observations	---
Example	Get Integer arctangent between p1(100,50) and p2(200,70)  Ldiaw 100 Ldiawt 50 Ldiw X,200 Ldiw Y,70 rcall _INT_ATN2PTS Call _INT_ATN2PTS (chips>=16k)

## Assembler Library 2 – Reference Manual

### IPTOS (IPTOS.INC File)

#### Description

Convert 32bits number to string ASCII formatted as  
aaa.bbb.ccc.ddd \0

#### Implemented Functions

Name	<b><i>__IPTOS</i></b>
Function	Convert 32bits number to string IP formatted.
Input values	<b>X,Y</b> IP number
Output values	<b>Z</b> -> SRAM STRING ASCII FORMATTED IP
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert to string a -1062680549 32bits value to formatted IP number.</p> <pre>Ldiw X,lwrd(-1062680549) Ldiw Y,hwrd(-1062680549) rcall __IPTOS Call __IPTOS (chips&gt;=16k)</pre> <p>Result string "192.168.200.27"\0</p>

# Assembler Library 2 – Reference Manual

## ITOS (ITOS.INC File)

### Description

Convert 16bits signed value to string ASCII with 0 ended \0.

### Implemented Functions

Name	<b><i>__ITOS</i></b>
Function	Convert 16bits unsigned value to string ASCII
Input values	<b>AccH:Acc</b> Signed value
Output values	<b>Z</b> -> SRAM STRING ASCII +\0
Destroy	Flags
Time	---
Observations	---
Example	Convert 1234 to string.  Ldiaw 1234 rcall __ITOS Call __ITOS (chips>=16k)  Result string "1234"\0

# Assembler Library 2 – Reference Manual

## IXTOS (IXTOS.INC File)

### Description

Convert byte,word,integer,long to string +\0.

### Implemented Functions

Name	<u>I_USE_SIZE</u>
Function	Set size for formatted output string
Input values	<b>Acc</b> Size
Output values	None
Destroy	Flags
Time	---
Observations	---
Example	Set output string size to 4.  Ldi <b>Acc</b> ,4 rcall <u>I_USE_SIZE</u> Call <u>I_USE_SIZE</u> (chips>=16k)

Name	<u>I_USE_PLUS</u>
Function	Set '+' sign before positive number
Input values	<b>Acc</b> =1 if use '+' before positive number 0 otherwise
Output values	None
Destroy	Flags
Time	---
Observations	---
Example	Set not plus signal in before number  Ldi <b>Acc</b> ,0 rcall <u>I_USE_PLUS</u> Call <u>I_USE_PLUS</u> (chips>=16k)

## Assembler Library 2 – Reference Manual

Name	<b><code>__I_USE_THOUSAND</code></b>
Function	Set Thousand separator of formatted numbers
Input values	<b>Acc</b> =1 used separator 0 otherwise
Output values	None
Destroy	Flags
Time	---
Observations	---
Example	Set use of thousand separator.  Ldi <b>Acc</b> ,1 rcall __I_USE_THOUSAND Call __I_USE_THOUSAND (chips>=16k)

Name	<b><code>__I_USE_SEP_CHAR</code></b>
Function	Set character for thousand separator
Input values	<b>Acc</b> =1 for point =0 for comma
Output values	None
Destroy	Flags
Time	---
Observations	---
Example	Set thousand separator character as comma.  Ldi <b>Acc</b> ,0 rcall __I_USE_SEP_CHAR Call __I_USE_SEP_CHAR (chips>=16k)

Name	<b><code>__IBTOS</code></b>
Function	Integer signed byte to string automatic length
Input values	<b>Acc</b> Signed byte
Output values	Z-> formatted automatic length
Destroy	Flags
Time	---
Observations	---
Example	Convert 45 to string automatic length  Ldi <b>Acc</b> ,15 rcall __IBTOS Call __IBTOS (chips>=16k)  Result "45\0"

## Assembler Library 2 – Reference Manual

Name	<b><i>__IBTOSF</i></b>
Function	Integer signed byte to string formatted length
Input values	<b>Acc</b> Signed byte
Output values	Z-> formatted length string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert 45 to string formatted length=5</p> <pre>Ldi  <b>Acc</b>,5 Call __I_USE_SIZE Ldi  <b>Acc</b>,45 rcall __IBTOS Call  __IBTOS (chips&gt;=16k)</pre> <p>Result " 45\0"</p>

Name	<b><i>__IUTOS</i></b>
Function	Integer unsigned word to string automatic length
Input values	<b>AccH:Acc</b> Signed word
Output values	Z-> formatted automatic string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert 1245 to string</p> <pre>Ldiaw 1245 rcall __IUTOS Call  __IUTOS (chips&gt;=16k)</pre> <p>Result "1245\0"</p>

## Assembler Library 2 – Reference Manual

Name	<b><i>__ITOS</i></b>
Function	Integer signed word to string automatic length
Input values	<b>AccH:Acc</b> Signed word
Output values	Z-> formatted automatic string
Destroy	Flags
Time	---
Observations	---
Example	Convert -1245 to string  Ldiw -1245 rcall __ITOS Call __ITOS (chips>=16k)  Result "-1245\0"

Name	<b><i>__ITOSF</i></b>
Function	Integer signed word to string formatted length
Input values	<b>AccH:Acc</b> Signed word
Output values	<b>Z-&gt;</b> formatted string
Destroy	Flags
Time	---
Observations	---
Example	Convert 1245 to string formatted size = 8, use thousand separator and plus sign  Ldi <b>Acc</b> ,8 Call __I_USE_SIZE Ldi <b>Acc</b> ,1 Call __I_USE_THOUSAND Ldi <b>Acc</b> ,1 Call __I_USE_SEP_CHAR Ldiaw 1245 rcall __ITOSF Call __ITOSF (chips>=16k)  Result " +1,245\0"

## Assembler Library 2 – Reference Manual

Name	<b><i>_IUTOSF</i></b>
Function	Integer unsigned word to string formatted length
Input values	<b>AccH:Acc</b> unsigned word
Output values	<b>Z-&gt;</b> formatted string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert 1245 to string formatted size = 8, use thousand separator and plus sign</p> <pre>Ldi <b>Acc</b>,8 Call <b>_I_USE_SIZE</b> Ldi <b>Acc</b>,1 Call <b>_I_USE_THOUSAND</b> Ldi <b>Acc</b>,1 Call <b>_I_USE_SEP_CHAR</b> Ldiaw 1245 rcall <b>_IUTOSF</b> Call <b>_IUTOSF</b> (chips&gt;=16k)</pre> <p>Result " +1,245\0"</p>

Name	<b><i>_IULTOS</i></b>
Function	Long Integer unsigned word to string automatic length
Input values	<b>AccTH:AccT:AccH:Acc</b> unsigned long
Output values	<b>Z-&gt;</b> formatted string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert 12345678 to string automatic size = 12, use thousand separator and plus sign</p> <pre>Ldi <b>Acc</b>,12 Call <b>_I_USE_SIZE</b> Ldi <b>Acc</b>,1 Call <b>_I_USE_THOUSAND</b> Ldi <b>Acc</b>,1 Call <b>_I_USE_SEP_CHAR</b> Ldial 12345678 rcall <b>_IULTOS</b> Call <b>_IULTOS</b> (chips&gt;=16k)</pre> <p>Result "+12,345,678\0"</p>

## Assembler Library 2 – Reference Manual

Name	<b><i>_ILTOS</i></b>
Function	Long Integer signed word to string automatic length
Input values	<b>AccTH:AccT:AccH:Acc</b> signed long
Output values	<b>Z-&gt;</b> formatted string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert -12345678 to string automatic size = 12, use thousand separator and plus sign</p> <pre>Ldi Acc,12 Call _I_USE_SIZE Ldi Acc,1 Call _I_USE_THOUSAND Ldi Acc,1 Call _I_USE_SEP_CHAR Ldial -12345678 rcall _IULTOS Call _IULTOS (chips&gt;=16k)  Result "-12,345,678\0"</pre>

Name	<b><i>_ILTOSF</i></b>
Function	Long Integer signed word to string formatted length
Input values	<b>AccTH:AccT:AccH:Acc</b> signed long
Output values	<b>Z-&gt;</b> formatted string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert -12345678 to string formatted size = 12, use thousand separator and plus sign</p> <pre>Ldi Acc,12 Call _I_USE_SIZE Ldi Acc,1 Call _I_USE_THOUSAND Ldi Acc,1 Call _I_USE_SEP_CHAR Ldial -12345678 rcall _IULTOS Call _IULTOS (chips&gt;=16k)  Result " -12,345,678\0"</pre>

## Assembler Library 2 – Reference Manual

Name	<b><i>_IULTOSF</i></b>
Function	Long Integer signed word to string formatted length
Input values	<b>AccTH:AccT:AccH:Acc</b> signed long
Output values	<b>Z-&gt;</b> formatted string
Destroy	Flags
Time	---
Observations	---
Example	<p>Convert 12345678 to string formatted size = 12, use thousand separator and plus sign</p> <pre>Ldi <b>Acc</b>,12 Call _I_USE_SIZE Ldi <b>Acc</b>,1 Call _I_USE_THOUSAND Ldi <b>Acc</b>,1 Call _I_USE_SEP_CHAR Ldial 12345678 rcall _IULTOS Call _IULTOS (chips&gt;=16k)  Result " +12,345,678\0"</pre>

## MULDIV\_U8U8U8 (MULDIV\_U8U8U8.INC File)

### Description

Multiply unsigned 8bits by unsigned 8bits and divide product by unsigned 8 bits. The orders of operations are A by B then divide by C, this useful for multiply a value by a fraction.

$$D = \frac{A.B}{C}$$

### Implemented Functions

Name	<u>MULDIV_U8U8U8</u>
Function	Multiply unsigned 8bits by unsigned 8bits and product is divided by unsigned 8bits
Input values	<b>R0</b> A value <b>R1</b> B value <b>R2</b> C value
Output values	<b>R1:R0</b> D Quotient <b>R5:R4</b> D Remainter
Destroy	Flags, R2, R3
Time	Min=278 Max=318 clocks
Observations	---
Example	Multiply 100 by 5/4  Ldi <b>Acc</b> , 100 Mov r0, <b>Acc</b> Ldi <b>Acc</b> , 5 Mov r1, <b>Acc</b> Ldi <b>Acc</b> , 4 Mov r2, <b>Acc</b>  rcall _MULDIV_U8U8U8 Call _MULDIV_U8U8U8 (chips>=16k)

# Assembler Library 2 – Reference Manual

## UBTOS (UBTOS.INC File)

### Description

Convert unsigned byte to string ASCII

### Implemented Functions

Name	<u>UBTOS</u>
Function	Convert unsigned byte to string ASCII automatic length
Input values	<b>Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 12 to string  Ldi <b>Acc</b> ,12 rcall <u>UBTOS</u> Call <u>UBTOS</u> (chips>=16k)  Result "12\0"

Name	<u>UBTOSU</u>
Function	Convert unsigned byte to string ASCII fixed 4 bytes length with format +nnn/0
Input values	<b>Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 12 to string  Ldi <b>Acc</b> ,12 rcall <u>UBTOSU</u> Call <u>UBTOSU</u> (chips>=16k)  Result "+012\0"

## Assembler Library 2 – Reference Manual

Name	<b><i>_UBTOSUS</i></b>
Function	Convert unsigned byte to string ASCII fixed 4 bytes length with format +nnn/0
Input values	<b>Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 12 to string  Ldi <b>Acc</b> ,12 rcall _UBTOSUS Call _UBTOSUS (chips>=16k)  Result "+ 12\0"

## Assembler Library 2 – Reference Manual

### UITOH (UITOH.INC File)

#### Description

Convert integer 16bits to 4digits HEX string ASCII .

#### Implemented Functions

Name	<u>UITOH</u>
Function	Convert integer 16bits to 4digits HEX string ASCII .
Input values	<b>AccH:Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 1000 to hex string  Ldiaw 1000 rcall _UITOH Call _UITOH (chips>=16k)  Result "03E8\0"

# Assembler Library 2 – Reference Manual

---

## UITOS (UBTOS.INC File)

### Description

Convert unsigned integer 16bits to string ASCII

### Implemented Functions

Name	<b><i>_UITOS</i></b>
Function	Convert unsigned integer 16bits to string ASCII automatic length
Input values	<b>AccH:Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 1234 to string  Ldiaw 1234 rcall _UITOS Call _UITOS (chips>=16k)  Result "1234\0"

Name	<b><i>_UITOSU</i></b>
Function	Convert unsigned byte to string ASCII fixed 6 bytes length with format +nnnnn/0
Input values	<b>AccH:Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 12 to string  Ldiaw <b>Acc</b> ,12 rcall _UITOSU Call _UITOSU (chips>=16k)  Result "+00012\0"

## Assembler Library 2 – Reference Manual

Name	<b><i>_UITOSUS</i></b>

### ULTOH (ULTOH.INC File)

#### Description

Convert integer 32bits to 8digits HEX string ASCII .

#### Implemented Functions

Name	<u>ULTOH</u>
Function	Convert integer 32bits to 8digits HEX string ASCII .
Input values	<b>AccTH:AccT:AccH:Acc</b> unsigned value
Output values	<b>Z-&gt;</b> SRAM string ASCII with zero ended
Destroy	Flags
Time	---
Observations	---
Example	Convert 1000 to hex string  Ldial 1000 rcall _ULTOH Call _ULTOH (chips>=16k)  Result "000003E8\0"

## INTFRAC – Integer and Fractions

### IF\_MUBSFB (MUBSFB.INC)

#### Description

Multiply unsigned byte by signed byte fraction useful for analog digital processing.

#### Implemented Functions

Name	<i><b>_IF_MUL_UBSFB</b></i>
Function	Multiply unsigned byte by signed byte fraction
Input values	<b>R0</b> unsigned integer <b>R1</b> signed fraction
Output values	<b>R3:R2</b> signed product
Destroy	Flags, R0
Time	----
Observations	----
Example	Multiply 100 by 0.34  Ldi <b>Acc</b> ,100 Mov r0, <b>Acc</b> Ldi <b>Acc</b> ,34*128/100 Mov r1, <b>Acc</b> rcall _IF_MUL_UBSFB Call _IF_MUL_UBSFB (chips>=16k)

## Assembler Library 2 – Reference Manual

### IF\_MUSFSI (MUSFSI.INC)

#### Description

Multiply signed integer by signed integer fraction useful for analog digital processing.

#### Implemented Functions

Name	<i>_IF_MUL_SFISI</i>
Function	Multiply signed integer by signed integer fraction
Input values	<b>R1:R0</b> signed fraction number <b>R3:R2</b> signed integer number
Output values	<b>R5:R4</b> signed integer product
Destroy	Flags, R0, R1, R2, R3, R6
Time	Min=156 Max=187
Observations	----
Example	Multiply 100 by 0.34  Ldiaw 100 Mov r0, <b>Acc</b> Mov r1, <b>AccH</b> Ldiaw 34*32768/10000 Mov r2, <b>Acc</b> Mov r3, <b>AccH</b> rcall _IF_MUL_SFISI Call _IF_MUL_SFISI (chips>=16k)

### LOGIC

#### PARITY (PARITY.INC)

##### Description

Check if byte parity is odd or even.

##### Implemented Functions

Name	<u>INTEGER_PARITY8</u>
Function	Check if byte parity is odd or even
Input values	R0 input value
Output values	Cy=1 if odd else even
Destroy	Flags,R1
Time	Max 22 clocks
Observations	----
Example	<pre>Check parity of Acc=3 "even"  Ldi Acc,3 Mov r0,Acc rcall _INTEGER_PARITY8 Call _INTEGER_PARITY8 (chips&gt;=16k)  Result CY=0</pre>

# Assembler Library 2 – Reference Manual

## ROTATION

### ROTATED2D (ROTATION2D.INC)

#### Description

Perform a 16bits rotation of **P(x,y)** point in relation at 16bits **C(x,y)** center pointer by angle **A**. This is performed using bellow trigonometrics reduction.

(1) rotation of point **P(px,py)** with center at **P(cx,cy)** by **α** angle.

$$r = \sqrt{(px - cx)^2 + (py - cy)^2}, \text{ } r = \text{distance between points}$$

$$\alpha = \text{atn2pts}(cx, cy, px, py), \quad \text{angle between } p(px, py) \text{ and } p(cx, cy)$$

$$npx = cx + r \cdot \cos(\alpha + \beta), \text{ rotation of } x \text{ axis by } \beta \text{ angle}$$

$$npy = cy + r \cdot \sin(\alpha + \beta), \text{ rotation of } y \text{ axis by } \beta \text{ angle}$$

Consider **a,b,c** side of triangle rectangle, **α** a opposite angle of side **a**, center pointer at intersection of side **c** and **a**, and desiderate point to be rotated at intersection of side **a** and **c**, yields:

$$a = py - cy, \quad b = px - cx, \quad \sin(\alpha) = \frac{a}{c}$$

$$c = \sqrt{a^2 + b^2}, \quad \cos(\alpha) = \frac{b}{c}$$

Using a law of sun of sines and cosines, where k is rotate angle follow

$$\sin(\alpha + k) = \sin(\alpha) \cdot \cos(k) + \sin(k) \cdot \cos(\alpha)$$

$$\cos(\alpha + k) = \cos(\alpha) \cdot \cos(k) - \sin(\alpha) \cdot \sin(k)$$

Replacing by equation (1), and have in mind that  $\cos(k)$  and  $\sin(k)$  area constants then,  $k=\cos(k)$  and  $j=\sin(k)$

$$\sin(\alpha + k) = \frac{a}{c} \cdot k + \frac{b}{c} \cdot j$$

$$\cos(\alpha + k) = \frac{b}{c} \cdot k - \frac{a}{c} \cdot j$$

## Assembler Library 2 – Reference Manual

Knowing that  $c = \sqrt{a^2 + b^2}$  represent a distance between points we rewrite rotation equation as follow

$$npx = cx + c \cdot \left( \frac{b}{c} \cdot k - \frac{a}{c} \cdot j \right), \text{rotation of } x \text{ axis by } k \text{ angle}$$

$$npy = cy + c \cdot \left( \frac{a}{c} \cdot k + \frac{b}{c} \cdot j \right), \text{rotation of } y \text{ axis by } k \text{ angle}$$

Cutting  $c$ =distance, yields

$$npx = cx + (b \cdot k - a \cdot j)$$

$$npy = cy + (a \cdot k + b \cdot j)$$

That manner we obtain a very fast routine because only need to realize is a table lookup of sine of desiderate request angle and 4 integer multiplies.

### Implemented Functions

Name	<u>_ROT2D_SET_POINT</u>
Function	Set coordinates of point to be rotated
Input values	<b>X,Y</b> point coordinates
Output values	None
Destroy	None
Time	----
Observations	----
Example	Set point P(100,150) to be rotated  Ldiw <b>X</b> ,100 Ldiw <b>Y</b> ,150 rcall _ROT2D_SET_POINT Call _ROT2D_SET_POINT (chips>=16k)

Name	<u>_ROT2D_GET_POINT</u>
Function	Get coordinates of point to be rotated
Input values	None
Output values	<b>X,Y</b> point coordinates
Destroy	None
Time	----
Observations	----
Example	Get point to be rotated, after this <b>X,Y</b> will have the coordinates  rcall _ROT2D_GET_POINT Call _ROT2D_GET_POINT (chips>=16k)

Name	<u>_ROT2D_SET_CENTER_POINT</u>
------	--------------------------------

## Assembler Library 2 – Reference Manual

<b>Function</b>	Set coordinates of center of rotation
<b>Input values</b>	<b>X,Y</b> center point coordiantes
<b>Output values</b>	None
<b>Destroy</b>	None
<b>Time</b>	----
<b>Observations</b>	----
<b>Example</b>	Set Center point P(100,150)  Ldiw <b>X</b> ,100 Ldiw <b>Y</b> ,150 rcall _ROT2D_SET_CENTER_POINT Call _ROT2D_SET_CENTER_POINT (chips>=16k)

<b>Name</b>	<b><i>_ROT2D_GET_CENTER_POINT</i></b>

### TRIGONOMETRY

#### DISCRETE COSINE (DISCRETE\_COSINE.INC)

##### Description

Calculate a integer 16bits discrete and scaled cosine.

Name	<b><code>_DSCOS16B</code></b>
Function	Compute scaled cosine using a below equation $y = s.\cos(\alpha)$ Where y=signed integer scaled cosine function A=signed integer angle S=unsigned integer scale
Input values	<b>AccH:Acc</b> angle in degree <b>AccTH:AccT</b> unsigned scale factor
Output values	<b>AccH:Acc</b> signed integer scaled cosine of angle A
Destroy	Flags,R0,R1,R2,R3,R4,R5,R6
Time	----
Observations	----
Example	Compute cosine of 100 degrees and scale it by a factor of 50  <pre>Ldiaw 100 Ldiawt 50 rcall _DSCOS16B Call _DSCOS16B (chips&gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<u>DCOS16B</u>															
Function	Compute discrete integer cosine															
Input values	AccH:Acc angle in degree															
Output values	AccH:Acc signed integer cosine of angle A															
Destroy	Flags,R0															
Time	----															
Observations	Output format of 16bits value of sine															
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	s	i	f	f	f	f	f	f	f	f	f	f	f	f	f	f

Example	Compute cosine of 100 degrees  Ldiaw 100 rcall _DCOS16B Call _DCOS16B (chips>=16k)															

## Assembler Library 2 – Reference Manual

### DISCRETE SINE (DISCRETE\_SINE.INC)

#### Description

Calculate a integer 16bits discrete and scaled sine.

Name	<b><code>_DSSIN16B</code></b>
Function	Compute scaled sine using a below equation $y = s.\sin(\alpha)$ Where y=signed integer scaled sine function A=signed integer angle S=unsigned integer scale
Input values	<b>AccH:Acc</b> angle in degree <b>AccTH:AccT</b> unsigned scale factor
Output values	<b>AccH:Acc</b> signed integer scaled sine of angle A
Destroy	Flags,R0,R1,R2,R3,R4,R5,R6
Time	----
Observations	----
Example	Compute sine of 100 degrees and scale it by a factor of 50  Ldiaw 100 Ldiawt 50 rcall _DSSIN16B Call _DSSIN16B (chips>=16k)

## Assembler Library 2 – Reference Manual

Name	<u>    _DSIN16B    </u>															
Function	Compute discrete integer cosine															
Input values	AccH:Acc angle in degree															
Output values	AccH:Acc signed integer cosine of angle A															
Destroy	Flags,R0															
Time	----															
Observations	Output format of 16bits value of sine															
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	s	i	f	f	f	f	f	f	f	f	f	f	f	f	f	f
	s=signal 0=positive 1=negative i=integer part f=fractionary part															
Example	Compute sine of 100 degrees  Ldiaw 100 rcall _DSIN16B Call _DSIN16B (chips>=16k)															

## Assembler Library 2 – Reference Manual

### DISPLAYS

#### HD44780

#### VERSION10 - Deprecated

#### VERSION20 (DPDRV48B.INC)

##### Description

The HD44780U dot-matrix liquid crystal display controller and driver LSI displays alphanumerics, Japanese kana characters, and symbols. It can be configured to drive a dot-matrix liquid crystal display under the control of a 4- or 8-bit microprocessor. Since all the functions such as display RAM, character generator, and liquid crystal driver, required for driving a dot-matrix liquid crystal display are internally provided on one chip, a minimal system can be interfaced with this controller/driver.

A single HD44780U can display up to one 8-character line or two 8-character lines. The HD44780U has pin function compatibility with the HD44780S which allows the user to easily replace an LCD-II with an HD44780U. The HD44780U character generator ROM is extended to generate Implemented Functions.

Author Version20 drive for HD4470 has a complete set of functions to use in 4 or 8bits mode using 5x8 or 5x10 character fonts, capable to use data bits in any port(no memory mapped port) in any bit position and have possibility to set a port for data and command in same port or separately.

# Assembler Library 2 – Reference Manual

---

## Implemented Functions

Name	<i><b>_DISP_INIT</b></i>
Function	Initialize HD44780 Interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	<p>Initialize HD44780 with DATA and COMMAND in same port in this case PORTC, RS bit=4,RW bit=5, E bit=6, two(2) lines, 5x8 font, interface 4 bits, interface bit start position 0.</p> <pre>.EQU _DISP_PORT_DATA_OUT      = PORTC .EQU _DISP_PORT_DATA_IN       = PINC .EQU _DISP_PORT_DATA_DIR      = DDRC  .EQU _DISP_PORT_CMD_OUT       = PORTC .EQU _DISP_PORT_CMD_IN        = PINC .EQU _DISP_PORT_CMD_DIR       = DDRC  .EQU _DISP_BIT_RS             = 4 .EQU _DISP_BIT_RW             = 5 .EQU _DISP_BIT_E              = 6  .EQU _DISP_LINE               = _DISP_LINE_2 .EQU _DISP_FONT               = _DISP_FONT_5X8 .EQU _DISP_INTERFACE          = _DISP_4BITS .EQU _DISP_POSITION           = 0  rcall _DISP_INIT call  _DISP_INIT (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b><code>_DISP_CMD_WRITE</code></b>
Function	Write a COMMAND in HD44780
Input values	<b>Acc</b> Command to be write
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Sent a command to clear display.  <code>Ldi <b>Acc</b>,_DISP_CMD_CLEAR</code> <code>rcall _DISP_CMD_WRITE</code> <code>call _DISP_CMD_WRITE (chips &gt;=16k)</code>

Name	<b><code>_DISP_DATA_WRITE</code></b>
Function	Write a DATA in HD44780
Input values	<b>Acc</b> Data to be write
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Sent a '*' to display.  <code>Ldi <b>Acc</b>, '*'</code> <code>rcall _DISP_DATA_WRITE</code> <code>call _DISP_DATA_WRITE (chips &gt;=16k)</code>

Name	<b><code>_DISP_SEND_STR</code></b>
Function	Send a string in FLASH to HD44780
Input values	<b>Z-&gt;</b> String in Flash
Output values	None
Destroy	Flags,R0
Time	----
Observations	----
Example	Sent a "Hello World" to display.  <code>Ldiw Z,MSG*2</code> <code>Rcall _DISP_SEND_STR</code> <code>call _DISP_SEND_STR (chips &gt;=16k)</code> <code>.</code> <code>.</code> <code>MSG: .DB "Hello World",0</code>

## Assembler Library 2 – Reference Manual

Name	<b><i>_DISP_SEND_STR_S</i></b>
Function	Send a string in SRAM to HD44780
Input values	<b>Z</b> -> String in SRAM
Output values	None
Destroy	Flags,R0
Time	----
Observations	----
Example	<p>Sent a "Hello World" to display.</p> <pre>Ldiw Z,MSG Rcall _DISP_SEND_STR_S call _DISP_SEND_STR_S (chips &gt;=16k) .</pre> <p>Memory position MSG must filled with "Hello World",0 message before execute above code</p> <pre>.DSEG     MSG:  .BYTE 11 .CSEG</pre>

Name	<b><i>_DISP_LOCATE</i></b>
Function	Set cursor position in HD44780
Input values	<b>Acc</b> Line <b>AccH</b> Column
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	<p>Put display cursor at line 2 column 5.</p> <pre>Ldi Acc,2 Ldi AccH,5 Rcall _DISP_LOCATE call _DISP_LOCATE (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b><code>_DISP_CLEAR</code></b>
Function	Clear entire display screen and position cursor at line 1 column 1
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Rcall <code>_DISP_CLEAR</code> call <code>_DISP_CLEAR</code> (chips >=16k)

Name	<b><code>_DISP_HOME</code></b>
Function	Put cursor at line 1 column 1
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Rcall <code>_DISP_HOME</code> call <code>_DISP_HOME</code> (chips >=16k)

Name	<b><code>_DISP_DATA_READ</code></b>
Function	Read contents of last cursor position from CGRAM or DDRAM
Input values	None
Output values	<b>Acc</b> Data read
Destroy	Flags
Time	----
Observations	----
Example	Rcall <code>_DISP_DATA_READ</code> call <code>_DISP_DATA_READ</code> (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b><i>__DISP_DISPLAY</i></b>
Function	Turn display character on screen visible or not
Input values	<b>Acc</b> _ON= Visible _OFF=hidden
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Turn display visible and hidden Ldi <b>Acc</b> ,_ON Rcall __DISP_DISPLAY Ldi <b>Acc</b> ,_OFF call __DISP_DISPLAY (chips >=16k)

Name	<b><i>__DISP_SCROLL_LEFT</i></b>
Function	Scroll entire display to left
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	rcall __DISP_SCROLL_LEFT call __DISP_SCROLL_LEFT (chips >=16k)

Name	<b><i>__DISP_SCROLL_RIGHT</i></b>
Function	Scroll entire display to right
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	rcall __DISP_SCROLL_RIGHT call __DISP_SCROLL_RIGHT (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b><i>__DISP_CURSOR</i></b>
Function	Turn cursor on or off
Input values	<b>Acc</b> <b>_ON</b> or <b>_OFF</b>
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Turn cursor off  Ldi <b>Acc</b> , <b>_OFF</b> rcall <b>__DISP_CURSOR</b> call <b>__DISP_CURSOR</b> (chips >=16k)

Name	<b><i>__DISP_CURSOR_LEFT</i></b>
Function	Move cursor to the left one position
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	rcall <b>__DISP_CURSOR_LEFT</b> call <b>__DISP_CURSOR_LEFT</b> (chips >=16k)

Name	<b><i>__DISP_CURSOR_RIGHT</i></b>
Function	Move cursor to the right one position
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	rcall <b>__DISP_CURSOR_RIGHT</b> call <b>__DISP_CURSOR_RIGHT</b> (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<u>__DISP_BLINK</u>
Function	Turn cursor blink state on or off
Input values	<b>Acc</b> <u>_ON</u> or <u>_OFF</u>
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Turn cursor blink off  Ldi <b>Acc</b> , <u>_OFF</u> rcall <u>__DISP_BLINK</u> call <u>__DISP_BLINK</u> (chips >=16k)

Name	<u>__DISP_SET_CGRAM_ADDR</u>
Function	Set address for further data write/read in CGRAM area
Input values	<b>Acc</b> address
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set CGRAM address to 5  Ldi <b>Acc</b> ,5 rcall <u>__DISP_SET_CGRAM_ADDR</u> call <u>__DISP_SET_CGRAM_ADDR</u> (chips >=16k)

Name	<u>__DISP_SET_DDRAM_ADDR</u>
Function	Set address for further data write/read in DDRAM area
Input values	<b>Acc</b> address
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set DRAM address to 5  Ldi <b>Acc</b> ,5 rcall <u>__DISP_SET_DDRAM_ADDR</u> call <u>__DISP_SET_DDRAM_ADDR</u> (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b><code>_DISP_REDEFINE_CHAR</code></b>
Function	Redefine character pattern for display codes 0..7
Input values	<b>Acc</b> character code 0..7 <b>Z-&gt;</b> Flash area with new character pattern
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set a box pattern to character 2  <pre>Ldi Acc,2 Ldiw Z,BOX_PATTERN rcall _DISP_SET_DDRAM_ADDR call _DISP_SET_DDRAM_ADDR (chips &gt;=16k)</pre> <pre>BOX_PATTERN: .DB 0x1f,0x11,0x11,0x11,0x11,0x11,0x1f,0x00</pre>

<b>HD44780 Constants</b>		
Name	Value	Description
<code>_DISP_LINE_1</code>	0	1 LINE
<code>_DISP_LINE_2</code>	1	2 LINE
<code>_DISP_FONT_5X8</code>	0	5X8 FONT SIZE
<code>_DISP_FONT_5X10</code>	1	5X10 FONT SIZE
<code>_DISP_4BITS</code>	0	4 bits interface
<code>_DISP_8BITS</code>	1	8 bits interface

# Assembler Library 2 – Reference Manual

## BIG\_NUMBERS (BIG\_NUMBER.INC)

### Description

Display Big Digits in displays with 2 lines, these digits use the bellow pattern.

```
-- -+      |  -- -+  -- -+ |  | +- -- +-      -- -+ +- -- +- --
|1 2| ' ' 3|    6 4| 6  4| |L 0| |5 6| |1 ' ' 7 2| |5 4| |5 4|
|  |      |  -- -+  -- -+ +- -+ +- -- |      | +- -- +- --
|  |      |  |      |      |      | +- -+      | |  |      |
|L 0| ' ' 3|  |L _  _ 0| ' ' 3|  - 0| |5 4| ' ' 3| |L 0| ' ' 3|
+- -+      |  +- --  -- -+      |  -- -+ +- --      | +- --      |
```

The above number represent characters codes 0..7, '-' '\', 'L', ' ' \, codes 0..7 was redefined during drive initialization.

Name	<i><b>_DISP_BIG_NUMBER_INIT</b></i>
Function	Initialize BIG NUMBERS redefining character pattern for display codes 0..7
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	Need HD44780 Version20 display drive
Example	rcall _DISP_SET_DDRAM_ADDR call _DISP_SET_DDRAM_ADDR (chips >=16k)

Name	<i><b>_DISP_PRINT_BIG_NUMBER</b></i>
Function	Put big number on display screen
Input values	<b>Acc</b> Number in ASCII
Output values	None
Destroy	Flags
Time	----
Observations	Need HD44780 Version20 display drive
Example	Put big number '3' at column 5  Ldi <b>Acc</b> , '3' Ldi <b>Acch</b> , 5 rcall _DISP_PRINT_BIG_NUMBER call _DISP_PRINT_BIG_NUMBER (chips >=16k)

## SED1335

### SED1335 (G320X240.INC)

#### Description

The SED1330/1335F/1336F is a family of versatile LCD controller ICs that can display text and graphics on a medium size LCD panel. The software is compatible among all three chips. S-MOS recommends new designs use the SED1335 since the SED1330 will gradually be replaced by the SED1335.

#### Features

- Text, graphics and combined text/graphics display modes
- Three overlapping screens in graphics mode
- 640 ´ 256 pixel LCD panel display resolution
- Programmable cursor control
- Smooth horizontal and vertical scrolling of all or part of the display
- 1/2-duty to 1/256-duty LCD drive
- Up to 64 Kbytes of external static RAM frame buffer memory
- Internal character generator
- 160, 5 ´ 7 pixel characters in internal mask programmed character generator ROM
- Up to 64, 8 ´ 16 pixel characters in external character generator RAM
- Up to 256, 8 ´ 16 pixel characters in external character generator ROM
- 6800 and 8080 family microprocessor interfaces

Author Version20 drive for SED1335 has a complete set of functions capable to use data bits in any port (no memory mapped port) have possibility to set a port for data and command in same port or separately.

# Assembler Library 2 – Reference Manual

---

## Implemented Functions

Name	<b><i>__DISP_INIT</i></b>
Function	Initialize SED1335 Interface
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	<p>Initialize SET1335 with DATA port in PORTA, COMMAND port in PORTB, WR bit=7, RD bit=6, CS bit=5, A0 bit=4, RESET bit=3.</p> <pre>.EQU __DISP_PORT_DATA_OUT      = PORTA .EQU __DISP_PORT_DATA_IN       = PINA .EQU __DISP_PORT_DATA_DIR      = DDRA  .EQU __DISP_PORT_CMD_OUT       = PORTB .EQU __DISP_PORT_CMD_IN        = PINB .EQU __DISP_PORT_CMD_DIR       = DDRB  .EQU __DISP_BIT_WR             = 7 .EQU __DISP_BIT_RD             = 6 .EQU __DISP_BIT_CS             = 5 .EQU __DISP_BIT_A0             = 4 .EQU __DISP_BIT_RESET          = 3  rcall __DISP_INIT call __DISP_INIT (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b><i>__DISP_FILL</i></b>
Function	Fill VRAM area with specific pattern
Input values	<b>X</b> Start Address of VRAM <b>Y</b> Number of bytes <b>Acc</b> Pattern
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Fill VRAM area start at 0 length of 1000 bytes with pattern 0xaa  Ldiw <b>X</b> ,0 Ldiw <b>Y</b> ,1000 Ldi <b>Acc</b> ,0xaa rcall __DISP_FILL call __DISP_FILL (chips >=16k)

Name	<b><i>__DISP_SET_CURSOR_ADDR</i></b>
Function	Set Cursor Address
Input values	<b>AccH:Acc</b> Cursor Address
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set cursor address to 1000H.  Ldiaw 0x1000 rcall __DISP_SET_CURSOR_ADDR call __DISP_SET_CURSOR_ADDR (chips >=16k)

Name	<b><i>__DISP_GET_CURSOR_ADDR</i></b>
Function	get Cursor Address
Input values	None
Output values	<b>AccH:Acc</b> Cursor Address
Destroy	Flags
Time	----
Observations	----
Example	rcall __DISP_GET_CURSOR_ADDR call __DISP_GET_CURSOR_ADDR (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b><i>_DISP_SEED</i></b>
Function	Define interface speed
Input values	<b>Acc</b> <code>_DP_SLOW</code> or <code>_DP_FAST</code>
Output values	None
Destroy	None
Time	----
Observations	SED1335 GENERATE A FLICKS ON SCREEN AT EACH COMMAND OR DATA RECEIVED , WHEN USER DEFINE A SLOW SPEED INTERFACE LESS FLICKS THEN GENERATE ON SCREEN
Example	Set interface speed to fast  <pre>Ldi Acc,_DP_FAST rcall _DISP_SPEED call _DISP_SPEED (chips &gt;=16k)</pre>

Name	<b><i>_DISP_CMD</i></b>
Function	Send a COMMAND to display
Input values	<b>Acc</b> COMMAND
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Send a COMMAND to set cursor direction increment to right  <pre>Ldi Acc,_DISP_CMD_CSRDIR_RIGHT rcall _DISP_CMD call _DISP_CMD (chips &gt;=16k)</pre>

Name	<b><i>_DISP_DATA</i></b>
Function	Send a DATA to display
Input values	<b>Acc</b> DATA
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Send a '*' to display  <pre>Ldi Acc,'*' rcall _DISP_DATA call _DISP_DATA (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b><i>_DISP_SET_LC</i></b>
Function	Set cursor position on screen
Input values	<b>XL</b> column <b>YL</b> line
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set cursor at line 2 column 5  Ldi <b>XL</b> ,5 Ldi <b>YL</b> ,2 rcall _DISP_SET_LC call _DISP_SET_LC (chips >=16k)

Name	<b><i>_DISP_SEND_STR</i></b>
Function	Send a string in FLASH to display
Input values	<b>Z-&gt;</b> String in Flash
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Sent a "Hello World" to display.  Ldiw Z,MSG*2 Rcall _DISP_SEND_STR call _DISP_SEND_STR (chips >=16k) . . MSG: .DB "Hello World",0

## Assembler Library 2 – Reference Manual

---

Name	<b><i>_DISP_SEND_STR_S</i></b>
Function	Send a string in SRAM to display
Input values	<b>Z</b> -> String in SRAM
Output values	None
Destroy	Flags,R0
Time	----
Observations	----
Example	<p>Sent a "Hello World" to display.</p> <pre>Ldiw Z,MSG Rcall _DISP_SEND_STR_S call _DISP_SEND_STR_S (chips &gt;=16k) .</pre> <p>Memory position MSG must filled with "Hello World",0 message before execute above code</p> <pre>.DSEG     MSG:  .BYTE 11 .CSEG</pre>

Name	<b><i>_DISP_PSET</i></b>
Function	Set or Clear a pixel at display coordinates
Input values	<b>X,Y</b> Coordinates <b>Acc</b> _ON to set _OFF to clear
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	<p>Set pixel at coordinates (160,120)</p> <pre>Ldiw <b>X</b>,160 Ldiw <b>Y</b>,120 Ldi <b>Acc</b>,_ON Rcall _DISP_PSET call _DISP_PSET (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b><code>_DISP_POINT</code></b>
Function	Get pixel stated at display coordinates
Input values	<b>X,Y</b> Coordinates
Output values	<b>Acc</b> <b>_ON</b> if set <b>_OFF</b> if clear
Destroy	Flags
Time	----
Observations	----
Example	Get pixel state at coordinates (160,120)  Ldiw <b>X</b> ,160 Ldiw <b>Y</b> ,120 Rcall <b>_DISP_POINT</b> call <b>_DISP_POINT</b> (chips >=16k)

<b><i>SED1335 Constants</i></b>		
Name	Value	Description
<b><code>_DISP_WIDTH</code></b>	320	Hardware display width
<b><code>_DISP_HEIGHT</code></b>	240	Hardware display height
<b><code>_DISP_SCALE_WIDTH</code></b>	320	Logical width
<b><code>_DISP_SCALE_HEIGHT</code></b>	240	Logical height
<b><code>_DISP_CMD_SYSTEM_SET</code></b>	0x40	Initialize display
<b><code>_DISP_CMD_SLEEP_IN</code></b>	0x53	Enter standby mode
<b><code>_DISP_CMD_DISP_OFF</code></b>	0x58	Disable display
<b><code>_DISP_CMD_DISP_ON</code></b>	0x59	Enable display
<b><code>_DISP_CMD_SCROLL</code></b>	0x44	Set display start Addr and regions
<b><code>_DISP_CMD_CSRFORM</code></b>	0x5d	Set cursor type
<b><code>_DISP_CMD_CGRAM_ADR</code></b>	0x5c	Set addr of character generator in RAM
<b><code>_DISP_CMD_CSRDIR_RIGHT</code></b>	0x4c	Set cursor movement to right
<b><code>_DISP_CMD_CSRDIR_LEFT</code></b>	0x4d	Set cursor movement to left
<b><code>_DISP_CMD_CSRDIR_UP</code></b>	0x4e	Set cursor movement to up
<b><code>_DISP_CMD_CSRDIR_DOWN</code></b>	0x4f	Set cursor movement to down
<b><code>_DISP_CMD_HDOT_SCR</code></b>	0x5a	Set Horizontal scroll position
<b><code>_DISP_CMD_OVLAY</code></b>	0x5b	Set display overlay format
<b><code>_DISP_CMD_CSWR</code></b>	0x46	Set cursor address
<b><code>_DISP_CMD_CSRR</code></b>	0x47	Read cursor address
<b><code>_DISP_CMD_MWRITE</code></b>	0x42	Write to display memory
<b><code>_DISP_CMD_MREAD</code></b>	0x43	Read to display memory
<b><code>_DISP_BIT_BUSY</code></b>	6	Internal bit busy flag

## SEVEN

### DRTYP1 (DIPS7DR1.INC)

#### Description

This drive is software generator scanning for seven segments display generally LED displays. It generate pattern for space, digits 0..9, and characters 'A' to 'Z' of course some character not possible to implement in seven segment but a close pattern is generated as follow.

```
SP  0   1   2   3   4   5   6   7   8   9

## Implemented Functions

Name	<b><code>_DISP7_INIT</code></b>
Function	Initialize Seven segment interface
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	Global interrupts are disable during initialization
Example	<p>Initialize using PORTB as segment, PORTD as Digits, Segment ON=LOW, Segment OFF=High, Digit ON=low, Digit OFF=High, Number of digits=8, segments bit number of A,B,C,E,F,G,P in sequence 0,1,2,3,4,5,6,7 and Digits bit numbers of 0,1,2,3,4,5,6,7 as same in sequence.</p> <pre>.EQU _DISP7_SEG_PORT_OUT      = PORTB .EQU _DISP7_SEG_PORT_DIR     = DDRB .EQU _DISP7_SEG_PORT_IN      = PINB  .EQU _DISP7_DIG_PORT_OUT     = PORTD .EQU _DISP7_DIG_PORT_DIR    = DDRD .EQU _DISP7_DIG_PORT_IN     = PIND  .EQU _DISP7_SEG_ON          = 0 .EQU _DISP7_SEG_OFF         = 1 .EQU _DISP7_DIG_ON          = 0 .EQU _DISP7_DIG_OFF         = 1  .EQU _DISP7_NUM_DIGITS     = 8  .EQU _DISP7_BIT_SEG_A      = 0</pre>

## Assembler Library 2 – Reference Manual

	<pre>.EQU _DISP7_BIT_SEG_B = 1 .EQU _DISP7_BIT_SEG_C = 2 .EQU _DISP7_BIT_SEG_D = 3 .EQU _DISP7_BIT_SEG_E = 4 .EQU _DISP7_BIT_SEG_F = 5 .EQU _DISP7_BIT_SEG_G = 6 .EQU _DISP7_BIT_SEG_P = 7  .EQU _DISP7_BIT_DIG_0 = 0 .EQU _DISP7_BIT_DIG_1 = 1 .EQU _DISP7_BIT_DIG_2 = 2 .EQU _DISP7_BIT_DIG_3 = 3 .EQU _DISP7_BIT_DIG_4 = 4 .EQU _DISP7_BIT_DIG_5 = 5 .EQU _DISP7_BIT_DIG_6 = 6 .EQU _DISP7_BIT_DIG_7 = 7  rcall _DISP7_INIT call _DISP7_INIT (chips &gt;=16k)</pre>
--	--

Name	<i><b>_DISP7_SHOW_DIGIT</b></i>
Function	Turn on one digit a time
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	IT'S RECOMMEND THAT PROGRAMMER TO USE THIS ROUTINE IN THE INTERRUPT HANDLE IN FIXED TIME AT 160Hz MINIMUM FREQUENCY.
Example	Using this without a interrupt routine  LOOP: Call _DISP7_SHOW_DIGIT 'INSERT CODE HERE TO PROCESS OTHER THINGS 'SINCHRONIZE TO FIXED RATE RJM LOOP

## Assembler Library 2 – Reference Manual

Name	<b><i>_DISP7_DATA</i></b>
Function	Send a character to display buffer
Input values	<b>Acc</b> Character ASCII
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Show 'A' on display  Ldi <b>Acc</b> , 'A' Rcall _DISP7_DATA call _DISP7_DATA (chips >=16k)

Name	<b><i>_DISP7_SEND_STR</i></b>
Function	Send String to display
Input values	<b>Z→</b> Flash string with zero ended \0
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Show 'ABCDEF' on display  Ldiw Z,MSG*2 Rcall _DISP7_SEND_STR call _DISP7_SEND_STR (chips >=16k)  MSG: .DB "ABCDEF",0

Name	<b><i>_DISP7_LOCATE</i></b>
Function	Set cursor position
Input values	<b>AccH</b> Column
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Position cursor at column 4  Ldi <b>Acc</b> ,4 Rcall _DISP7_LOCATE call _DISP7_LOCATE (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<i>_DISP7_CLS</i>
Function	Clear character buffer
Input values	None
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Rcall _DISP7_CLS call _DISP7_CLS (chips >=16k)

# Assembler Library 2 – Reference Manual

## GRAPH

### CIRCLE (CIRCLE.INC)

#### Description

Draw a Circle in any graph device that has implement a \_DISP\_PSET routine.

#### Implemented Functions

Name	<b>_GRAPH_CIRCLE</b>
Function	Draw a circle at any graph interface
Input values	<b>X,Y</b> Circle coordinates <b>AccTH:AccT</b> radius <b>Acc</b> Pixel color, if monochrome display _ON or _OFF
Output values	None
Destroy	None
Time	----
Observations	User must be define a routine called _DISP_PSET that receiver <b>X,Y</b> with coordinates parameters and <b>Acc</b> with color.
Example	Draw circle at coordinates (128,102) with radius=100  Ldiw X,128 Ldiw Y,102 Ldiawt 100 Idi <b>Acc</b> ,_ON rcall _GRAPH_CIRCLE call _GRAPH_CIRCLE (chips >=16k)

# Assembler Library 2 – Reference Manual

## LINE (LINE.INC)

### Description

Draw a line in any graph device that has implement a `_DISP_PSET` routine that receiver **X,Y** register with coordinates and **Acc** with pixel color.

### Implemented Functions

Name	<code>_GRAPH_MOVE_TO</code>
Function	Move a virtual pen to specific coordinate that represent a initial line coordinate
Input values	<b>AccH:Acc</b> <b>X</b> coordinate <b>AccTH:AccT</b> <b>Y</b> coordinate
Output values	None
Destroy	None
Time	----
Observations	----
Example	Move graph cursor to coordinates (10,20)  Ldiaw 10 Ldiawt 20 rcall <code>_GRAPH_MOVE_TO</code> call <code>_GRAPH_MOVE_TO</code> (chips >=16k)

Name	<code>_GRAPH_MOVE_TO_EX</code>
Function	Same as <code>_GRAPH_MOVE_TO</code> but use <b>X,Y</b> register instead
Input values	<b>X,Y</b> Coordinates to move
Output values	None
Destroy	None
Time	----
Observations	----
Example	Move graph cursor to coordinates (10,20)  Ldiw <b>X</b> ,10 Ldiw <b>Y</b> ,20 rcall <code>_GRAPH_MOVE_TO_EX</code> call <code>_GRAPH_MOVE_TO_EX</code> (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b>_GRAPH_GET_POINT</b>
Function	Get coordinates of virtual pen
Input values	None
Output values	<b>X,Y</b> Coordinates of pen
Destroy	None
Time	----
Observations	----
Example	<pre>rcall _GRAPH_GET_POINT call _GRAPH_GET_POINT (chips &gt;=16k)</pre>

Name	<b>_GRAPH_LINE_TO</b>
Function	Draw a line any device from virtual pen coordinates to coordinates provide in this routine
Input values	X,Y End Coordinates
Output values	Flags,r0..r13
Destroy	None
Time	----
Observations	----
Example	<pre>Draw a line from coordinates (10,20) to coordinates (150,200)  Ldiw X,10 Ldiw y,20 Call _GRAPH_MOVE_TO_EX Ldiw x,150 Ldiw Y,200 Ldi Acc,_ON Call _GRAPH_LINE_TO</pre>

# Assembler Library 2 – Reference Manual

## **DRAW (DRAW.INC)**

### **Description**

Draw is similar a DRAW command used in some BASIC languages that allow graphics drawing using a vectors defined by a string using ASCII characters like commands. Below as list of these commands.

#### Ortogonal moves

```
nnnU - draw a vector up      ( 90o)
nnnR - draw a vector right   (  0o)
nnnD - draw a vector down    (270o)
nnnL - draw a vector left    (180o)
```

#### Diagonal moves

```
nnnE - draw a vector up and right   ( 45o)
nnnF - draw a vector down and right (315o)
nnnG - draw a vector down and left  (227o)
nnnH - draw a vector up and left    (135o)
```

#### Free moves

```
sxxx,syyyP - draw a vector to PX+xxx,PY+yyy
```

#### Pen control

```
W - Turn pen on
B - Turn pen off
```

Where nnn,xxx,yyy is a values ranging 0 to 255 meaning vector length, the below string draw on device a word "DRAW".

```
"10U4R2F6D2G4LB8RW10U4R2F2D2G4LB4RW4FB2RW8U2E2R2F4D6LB6RW4DB2R10
UW10D5E5F10U"
```

# Assembler Library 2 – Reference Manual

---

## Implemented Functions

Name	<b>_DRAW_SET_POINT</b>
Function	Define a start point of vectors
Input values	<b>X,Y</b> Start point Coordinates
Output values	None
Destroy	None
Time	----
Observations	----
Example	Set start coordinate at (0,0) Ldiw <b>X</b> ,0 Ldiw <b>Y</b> ,0 rcall _DRAW_SET_POINT call _DRAW_SET_POINT (chips >=16k)

Name	<b>_DRAW_GET_POINT</b>
Function	Get a start point of vectors
Input values	None
Output values	<b>X,Y</b> Start point Coordinates
Destroy	None
Time	----
Observations	----
Example	rcall _DRAW_GET_POINT call _DRAW_GET_POINT (chips >=16k)

Name	<b>_DRAW_SET_CENTER_POINT</b>
Function	Define a center point for vectors rotation
Input values	<b>X,Y</b> center point Coordinates
Output values	None
Destroy	None
Time	----
Observations	----
Example	Set center rotate point coordinate at (100,200) Ldiw <b>X</b> ,100 Ldiw <b>Y</b> ,200 rcall _DRAW_SET_CENTER_POINT call _DRAW_SET_CENTER_POINT (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_DRAW_GET_CENTER_POINT</b>
Function	Get a center point of vectors rotation
Input values	None
Output values	<b>X,Y</b> Start point Coordinates
Destroy	None
Time	----
Observations	----
Example	<pre>rcall _DRAW_GET_CENTER_POINT call  _DRAW_GET_POINT (chips &gt;=16k)</pre>

Name	<b>_DRAW_SET_SCALE</b>
Function	Set scale of vectors
Input values	<b>AccH:Acc</b> <b>AccH</b> integer part, <b>Acc</b> fractinary part
Output values	None
Destroy	None
Time	----
Observations	----
Example	<pre>Set scale to 2.5  Ldiaw (2+50/100)*256 rcall _DRAW_SET_SCALE call  _DRAW_SET_SCALE (chips &gt;=16k)</pre>

Name	<b>_DRAW_GET_SCALE</b>
Function	Get scale of vectors
Input values	None
Output values	<b>AccH:Acc</b> scale
Destroy	None
Time	----
Observations	----
Example	<pre>rcall _DRAW_GET_SCALE call  _DRAW_GET_SCALE (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

---

Name	<b>_DRAW_SET_ROTATE_ANGLE</b>
Function	Set rotate angle of output set of vectors
Input values	<b>AccH:Acc</b> angle in degrees
Output values	None
Destroy	None
Time	----
Observations	----
Example	Set rotate angle to 50  Ldiaw 50 rcall _DRAW_SET_ROTATE_ANGLE call _DRAW_SET_ROTATE_ANGLE (chips >=16k)

Name	<b>_DRAW_SAVE_POINT</b>
Function	Save start point for further use
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	rcall _DRAW_SAVE_SCALE call _DRAW_SAVE_SCALE (chips >=16k)

Name	<b>_DRAW_RESTORE_POINT</b>
Function	Restore start point
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	rcall _DRAW_RESTORE_POINT call _DRAW_RESTORE_POINT(chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b>_DRAW</b>
Function	Draw set of vectors on device
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	<p>Draw a word "DRAW" on graph device</p> <pre>Ldiw Z,MSG*2 rcall _DRAW call _DRAW(chips &gt;=16k)</pre> <p>MSG: .db "10U4R2F6D2G4LB8RW10U4R2F2D2G4LB4RW4FB2RW8U2E2R2F4D6LB 6RW4DB2R10UW10D5E5F10U",0</p>

## Assembler Library 2 – Reference Manual

### EEPROMS

#### AT24C64 (AT24C64.INC)

##### Description

The AT24C32/64 provides 32,768/65,536 bits of serial electrically erasable and programmable read only memory (EEPROM) organized as 4096/8192 words of 8 bits each. The device's cascadable feature allows up to 8 devices to share a common 2-wire bus.

##### Implemented Functions

Name	<u>AT24C64_BYTE_WRITE</u>
Function	Write a byte into AT24C64 chip
Input values	<b>Acc</b> Data to be write <b>AccH</b> Device Address <b>AccTH:AccT</b> Memory Address
Output values	None
Destroy	None
Time	----
Observations	----
Example	Write a Byte 0x5a in device 5 at address 1000  Ldi <b>Acc</b> ,0x5a Ldi <b>AccH</b> ,5 Ldiawt 1000 rcall <u>AT24C64_BYTE_WRITE</u> call <u>AT24C64_BYTE_WRITE</u> (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b>_AT24C64_BYTE_READ</b>
Function	Read a byte from AT24C64 chip
Input values	<b>AccH</b> Device Address <b>AccTH:AccT</b> Memory Address
Output values	<b>Acc</b> Read Data
Destroy	None
Time	----
Observations	----
Example	Read a Byte in device 5 at address 1000  Ldi <b>AccH</b> ,5 Ldiawt 1000 rcall _AT24C64_BYTE_READ call _AT24C64_BYTE_READ (chips >=16k)

## Assembler Library 2 – Reference Manual

### AVRE2P (BE256.INC)

#### Description

Drive to write/read EEPROM in AVR device with EEPROM size <=256 bytes.

#### Implemented Functions

Name	<b>_EEPROM_WRITE</b>
Function	Write a byte into EEPROM
Input values	<b>Acc</b> Data to be write <b>AccH</b> Address
Output values	None
Destroy	None
Time	----
Observations	----
Example	Write a Byte 0x5a 5 at address 100  Ldi <b>Acc</b> ,0x5a Ldi <b>AccH</b> ,100 rcall _EEPROM_WRITE call _EEPROM_WRITE (chips >=16k)

Name	<b>_EEPROM_READ</b>
Function	Read a byte from EEPROM
Input values	<b>AccH</b> Address
Output values	<b>Acc</b> read Data
Destroy	None
Time	----
Observations	----
Example	Read a Byte at address 100  Ldi <b>AccH</b> ,100 rcall _EEPROM_READ call _EEPROM_READ (chips >=16k)

# Assembler Library 2 – Reference Manual

## AVRE2P (A256.INC)

### Description

Drive to write/read EEPROM in AVR device with EEPROM size >256 bytes.

### Implemented Functions

Name	<b>__EEPROM_WRITE</b>
Function	Write a byte into EEPROM
Input values	<b>Acc</b> Data to be write <b>AccT:AccH</b> Address
Output values	None
Destroy	None
Time	----
Observations	----
Example	Write a Byte 0x5a 5 at address 100  Ldi <b>Acc</b> ,0x5a Ldi <b>AccH</b> ,low(100) Ldi <b>AccT</b> ,high(100) rcall __EEPROM_WRITE call __EEPROM_WRITE (chips >=16k)

Name	<b>__EEPROM_READ</b>
Function	Read a byte from EEPROM
Input values	<b>AccT:AccH</b> Address
Output values	<b>Acc</b> read Data
Destroy	None
Time	----
Observations	----
Example	Read a Byte at address 100  Ldi <b>AccH</b> ,low(100) Ldi <b>AccT</b> ,high(100) rcall __EEPROM_READ call __EEPROM_READ (chips >=16k)

# Assembler Library 2 – Reference Manual

## DATA FLASH

### AT45DB161-B

#### Description

The AT45DB161B is a 2.5-volt or 2.7-volt only, serial interface Flash memory ideally suited for a wide variety of digital voice-, image-, program code and data-storage applications. Its 17,301,504 bits of memory are organized as 4096 pages of 528 bytes each. In addition to the main memory, the AT45DB161B also contains two SRAM data buffers of 528 bytes each. The buffers allow receiving of data while a page in the main memory is being reprogrammed, as well as writing a continuous data stream. EEPROM emulation (bit or byte alterability) is easily handled with a self-contained three step Read-Modify-Write operation. Unlike conventional Flash memories that are accessed randomly with multiple address lines and a parallel interface, the DataFlash uses a SPI serial interface to sequentially access its data. DataFlash supports SPI mode 0 and mode 3. The simple serial interface facilitates hardware layout, increases system reliability, minimizes switching noise, and reduces package size and active pin count. The device is optimized for use in many commercial and industrial applications where high density, low pin count, low voltage, and low power are essential. The device operates at clock frequencies up to 20 MHz with a typical active read current consumption of 4 mA.

# Assembler Library 2 – Reference Manual

## Implemented Functions

Name	<b>_AT45DB161B_INIT</b>
Function	Initialize AT45DB161B Interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disable during initialization.
Example	<p>Initialize device using data port as PORTA, Reset Port as PORTB, WP port as PORTC, SO bit=0, SI bit=1, SCK bit=2, CS bit=3, WP bit=0, RESET bit=1</p> <pre>.EQU _AT45DB161B_PORT_OUTPUT = PORTA .EQU _AT45DB161B_PORT_DIR    = DDRxA .EQU _AT45DB161B_PORT_INPUT  = PINxA  .EQU _AT45DB161B_RESET_OUTPUT= PORTB .EQU _AT45DB161B_RESET_DIR   = DDRxB .EQU _AT45DB161B_RESET_INPUT = PINB  .EQU _AT45DB161B_WP_OUTPUT   = PORTC .EQU _AT45DB161B_WP_DIR      = DDRC .EQU _AT45DB161B_WP_INPUT    = PINC  .EQU _AT45DB161B_SO_BIT      = BIT0 .EQU _AT45DB161B_SI_BIT      = BIT1 .EQU _AT45DB161B_SCK_BIT     = BIT2 .EQU _AT45DB161B_CS_BIT      = BIT3 .EQU _AT45DB161B_WP_BIT      = BIT0 .EQU _AT45DB161B_RESET_BIT   = BIT1  rcall _AT45DB161B_INIT call  _AT45DB161B_INIT (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_AT45DB161B_RESET</b>
Function	Reset AT45DB161B
Input values	None
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disable during initialization.
Example	<pre>rcall _AT45DB161B_RESET call  _AT45DB161B_RESET (chips &gt;=16k)</pre>

Name	<b>_AT45DB161B_DATA_OUT</b>
Function	Send Data or Command AT45DB161B
Input values	<b>Acc</b> Data or Command
Output values	None
Destroy	None
Time	80 clocks
Observations	- Global interrupts are disable during initialization. SPI Mode 3 is asserted
Example	<pre>Send continuous_array_read command to chip  ldi   <b>Acc</b>, _AT45DB161B_SPI3_CMD_CONTINUOUS_ARRAY_READ rcall _AT45DB161B_DATA_OUT call  _AT45DB161B_DATA_OUT (chips &gt;=16k)</pre>

Name	<b>_AT45DB161B_DATA_IN</b>
Function	Read Data from AT45DB161B
Input values	None
Output values	<b>Acc</b> Data
Destroy	None
Time	44 clocks
Observations	- Global interrupts are disable during initialization. SPI Mode 3 is asserted
Example	<pre>rcall _AT45DB161B_DATA_IN call  _AT45DB161B_DATA_IN (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b><code>_AT45DB161B_DATA_END</code></b>
Function	Finish data transfer to AT45DB161B
Input values	None
Output values	None
Destroy	None
Time	---
Observations	- Global interrupts are disable during initialization. SPI Mode 3 is asserted
Example	<code>rcall _AT45DB161B_DATA_END</code> <code>call _AT45DB161B_DATA_END (chips &gt;=16k)</code>

Name	<b><code>_AT45DB161B_DATA_START</code></b>
Function	Start data transfer to AT45DB161B
Input values	None
Output values	None
Destroy	None
Time	---
Observations	- Global interrupts are disable during initialization. SPI Mode 3 is asserted
Example	<code>rcall _AT45DB161B_DATA_START</code> <code>call _AT45DB161B_DATA_START (chips &gt;=16k)</code>

Name	<b><code>_AT45DB161B_SET_WRITE_PROTECT</code></b>
Function	Set WP pin state of AT45DB161B
Input values	<b>Acc</b> <code>_ON=Protect _OFF=release</code>
Output values	None
Destroy	None
Time	---
Observations	---
Example	<code>rcall _AT45DB161B_SET_WRITE_PROTECT</code> <code>call _AT45DB161B_SET_WRITE_PROTECT (chips &gt;=16k)</code>

## Assembler Library 2 – Reference Manual

<b>Name</b>	<b>_AT45DB161B_GET_STATUS_REGISTER</b>
<b>Function</b>	Get status register state of AT45DB161B
<b>Input values</b>	None
<b>Output values</b>	Acc status Bit 7=READY/BUSY state 1=READ 0=BUSY Bit 6=COMPARE 0=compare math memory Bit 5=1,bit 4=0,bit 3=1,bit 2=1, bit 1=x, bit 0=x

## Analog to Digital Converters

### ADC831

#### Description

ADC831 or TLC831 chip is a 8bit Analog to Digital Converter with serial control and diferencial input. This device is a 8bit successive approximation analog to digital converters. The serial output is configured to interface with standard shift registers or microprocessors.

#### Implemented Functions

Name	<b>ADC831_INIT</b>
Function	Initialize ADC831 Interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	<ul style="list-style-type: none"><li>- Global interrupts are disable during initialization.</li><li>- After this initialization CLK,CS,DATA are in high level, CLK,CS as output and Data as input.</li></ul>
Example	<p>Define PORT where the ADC831 is connected in this example PORTB</p> <pre>.EQU _ADC831_PORT_OUT= PORTB .EQU _ADC831_PORT_IN  = PINB .EQU _ADC831_PORT_DIR= DDRB</pre> <p>Define pin bit numbers</p> <pre>.EQU _ADC831_BIT_CLK   = 0 .EQU _ADC831_BIT_CS    = 1 .EQU _ADC831_BIT_DATA= 2</pre> <p>Then initialize one of below two methods</p> <pre>rcall _ADC831_INIT call  _ADC831_INIT (chips &gt;=16k)</pre>
Name	<b>_ADC831_GET</b>

## Assembler Library 2 – Reference Manual

<b>Function</b>	Get 8bit unsigned value from ADC831	
<b>Input values</b>	None	
<b>Output values</b>	<b>Acc</b> 8bit unsigned value	
<b>Destroy</b>	Flags	
<b>Time</b>	<b>Average conversion time</b>	<b>Frequency</b>
	151.0uS	1Mhz
	37.6uS	4Mhz
	25.2uS	6Mhz
	18.9uS	8Mhz
	22.0uS	10Mhz
	20.1uS	14.3Mhz
	22.3uS	16Mhz
<b>Observations</b>	---	
<b>Example</b>	After below one of both calls <b>Acc</b> with ADC831 value rcall _ADC831_GET call _ADC831_GET (chips >=16k)	

## Assembler Library 2 – Reference Manual

### ADC832

#### Description

ADC832 or TLC832 chip is a 8bit Analog to Digital Converter with serial control and have 2 input channels. This device is a 8bit successive approximation analog to digital converters. The serial output is configured to interface with standard shift registers or microprocessors.

#### Implemented Functions

Name	<b>_ADC832_INIT</b>
Function	Initialize ADC832 Interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	<ul style="list-style-type: none"><li>- Global interrupts are disable during initialization.</li><li>- After this initialization CLK,CS,DATA_OUT,DATA_IN are in high level, CLK,CS,DATA_OUT as output and DATA_IN as input</li></ul>
Example	<pre>Define PORT where the ADC832 is connected in this example PORTB  .EQU _ADC832_PORT_OUT= PORTB .EQU _ADC832_PORT_IN  = PINB .EQU _ADC832_PORT_DIR= DDRB  Define pin bit numbers  .EQU _ADC832_BIT_CLK   = 0 .EQU _ADC832_BIT_CS   = 1 .EQU _ADC832_BIT_DATA_OUT = 2 .EQU _ADC832_BIT_DATA_IN=3  Then initialize one of below two methods  rcall _ADC832_INIT call  _ADC832_INIT (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_ADC832_GET</b>	
Function	Get 8bit unsigned value from ADC831	
Input values	<b>Acc</b> Channel 0 or 1	
Output values	<b>Acc</b> 8bit unsigned value	
Destroy	Flags	
Time	<b>Average conversion time</b>	<b>Frequency</b>
	166.0uS	1Mhz
	41.5uS	4Mhz
	27.7uS	6Mhz

	23.8uS	10Mhz
	21.7uS	14.3Mhz
	23.8uS	16Mhz
Observations	---	
Example	Set <b>Acc</b> with channel 1 after below one of both calls <b>Acc</b> with ADC832 value  Ldi   Acc,1 rcall _ADC831_GET call  _ADC831_GET (chips >=16k)	

## Assembler Library 2 – Reference Manual

### ADC8535

#### Description

ADC8535 is a 10bit Analog to Digital Converter internal of AT90S8535 microcontroller or other equivalents of AVR family.

#### Implemented Functions

Name	<b>_ADC_INIT</b>
Function	Initialize internal ADC engine
Input values	<b>Acc</b> CLK prescaler factor in power of 2 1=2,2=4,3=8
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disable during initialization.
Example	Initialize ADC with prescaler = 2  Ldi <b>Acc</b> ,2 rcall _ADC_INIT call  _ADC_INIT (chips >= 16k)

Name	<b>_ADC_CHANNEL</b>
Function	Set multiplexed channel to be use
Input values	<b>Acc</b> channel number 0 to 7
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set ADC channel to 3  Ldi <b>Acc</b> ,3 rcall _ADC_CHANNEL call  _ADC_CHANNEL (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b>_ADC_GET</b>
Function	Get unsigned 10bit value from ADC
Input values	None
Output values	<b>AccH:Acc</b> has 10bit value
Destroy	Flags
Time	----
Observations	----
Example	After below both examples <b>AccH:Acc</b> have the 10bit value from ADC  <pre>rcall _ADC_GET call _ADC_GET (chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

### ADCM128

#### Description

ADCM128 is a 10bit Analog to Digital Converter internal of ATMEGA128 microcontroller or other equivalents of AVR family.

#### Implemented Functions

Name	<b>_ADC_INIT</b>
Function	Initialize internal ADC engine
Input values	<b>Acc</b> CLK prescaler factor in power of 2 1=2,2=4,3=8
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disable during initialization.
Example	Initialize ADC with prescaler = 2  Ldi <b>Acc</b> ,2 rcall _ADC_INIT call  _ADC_INIT (chips >=16k)

Name	<b>_ADC_SET_CHANNEL</b>
Function	Set multiplexed channel to be use
Input values	<b>Acc</b> channel number 0 to 7
Output values	None
Destroy	Flags
Time	----
Observations	----
Example	Set ADC channel to 3  Ldi <b>Acc</b> ,3 rcall _ADC_CHANNEL call  _ADC_CHANNEL (chips >=16k)

## Assembler Library 2 – Reference Manual

Name	<b>_ADC_GET_CHANNEL</b>
Function	Get multiplexed channel in use
Input values	None
Output values	<b>Acc</b> channel number 0 to 7
Destroy	None
Time	----
Observations	----
Example	<p>Get ADC channel in use, After below of both calls <b>Acc</b> has the channel number in use.</p> <pre>rcall _ADC_GET_CHANNEL call  _ADC_GET_CHANNEL (For chips with more 16k)</pre>

Name	<b>_ADC_GET_VALUE</b>
Function	Get unsigned 10bit value from ADC
Input values	<b>None</b>
Output values	<b>AccH:Acc</b> has 10bit value
Destroy	Flags
Time	----
Observations	----
Example	<p>After below both examples <b>AccH:Acc</b> have the 10bit value from ADC</p> <pre>rcall _ADC_GET_VALUE call  _ADC_GET_VALUE (chips &gt;=16k)</pre>

# Assembler Library 2 – Reference Manual

## ADS8320 (Texas Instruments/Burr-Brown)

### Description

The ADS8320 is a 16-bit sampling analog-to-digital converter with guaranteed specifications over a 2.7V to 5.25V supply range. It requires very little power even when operating at the full 100kHz data rate. At lower data rates, the high speed of the device enables it to spend most of its time in the power-down mode the average power dissipation is less than 100mW at 10kHz data rate

### Implemented Functions

Name	<code>_ADS8320_INIT</code>
Function	Initialize ADS8320 interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disable during initialization.
Example	<pre>Define PORT where the ADS8320 is connected in this example PORTB  .EQU _ADS8320_PORT_OUT= PORTB .EQU _ADS8320_PORT_IN = PINB .EQU _ADS8320_PORT_DIR= DDRB  Define pin bit numbers  .EQU _ADS832_BIT_CLK   = 0 .EQU _ADS832_BIT_CS = 1 .EQU _ADS832_BIT_DATA= 2  Then initialize one of below two methods  rcall _ADS8320_INIT call  _ADS8320_INIT (Chips &gt;=16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_ADS8320_GET</b>
Function	Get 16bit value from ADS8320
Input values	None
Output values	<b>AccH:Acc</b> 16bit value
Destroy	Flags
Time	----
Observations	----
Example	<p>After below both examples <b>AccH:Acc</b> have the 16bit value from ADC</p> <pre>rcall _ADS8320_GET_VALUE call  _ADS8320_GET_VALUE(chips &gt;=16k)</pre>

## Astronomy

### Julian Day

#### Description

The Julian day or Julian day number (JDN) is the integer number of days that have elapsed since an initial epoch defined as noon Universal Time (UT) Monday, January 1, 4713 BC in the proleptic Julian calendar. That noon-to-noon day is counted as Julian day 0. Negative values can also be used, although those predate all recorded history. Now, at 18:55, Thursday August 28, 2008 (UTC) the JDN is 2454707.

The Julian date (JD) is a continuous count of days and fractions elapsed since the same initial epoch. Currently the JD is 2454707.28844. The integral part (its floor) gives the Julian day number. The fractional part gives the time of day since noon UT as a decimal fraction of one day or fractional day, with 0.5 representing midnight UT. Typically, a 64-bit floating point (double precision) variable can represent an epoch expressed as a Julian date to about 1 millisecond precision. This routine compute Julian day according below equation:

$$y = year$$

$$m = month$$

$$d = day$$

If  $m \leq 2$  then

$$m = m + 12$$

$$y = y - 1$$

## Assembler Library 2 – Reference Manual

---

If calendar is Julian then,

$$b = -2 + \text{fix}\left(\frac{y + 4716}{4}\right) - 1179$$

Else

$$b = \text{fix}\left(\frac{y}{400}\right) - \text{fix}\left(\frac{y}{100}\right) + \text{fix}\left(\frac{y}{4}\right)$$

Then

$$a = 365 * y + 1720996.5$$

And

$$\text{Julian day} = a + b + \text{fix}(30.6001 * (m + 1)) + d$$

### Implemented Functions

Name	<code>_JULIAN_DAY_INIT</code>
Function	Initialize <code>_JULIAN_DAY</code> Object
Input values	None
Output values	None
Destroy	Flags, register R0..R15
Time	----
Observations	- Global interrupts are disable during initialization.
Example	Call below one of both methods to initialize  <code>rcall _JULIAN_DAY_INIT</code> <code>call _JULIAN_DAY_INIT (Chips &gt;= 16k)</code>

## Assembler Library 2 – Reference Manual

Name	<b>_JULIAN_DAY_SET_DATE</b>
Function	Set desiderated date for computation
Input values	<b>Acc</b> Day 1..31 <b>AccH</b> Month 1..12 <b>AccTH:AccT</b> Year
Output values	None
Destroy	None
Time	----
Observations	----
Example	Set date to Abril 6 of 1964  Ldi <b>Acc</b> , 6 Ldi <b>AccH</b> , 4 Ldiawt 1964 rcall _JULIAN_DAY_SET_INIT call _JULIAN_DAY_SET_INIT (chips >= 16k)

Name	<b>_JULIAN_DAY_GET_DATE</b>
Function	Get date
Input values	None
Output values	<b>Acc</b> Day 1..31 <b>AccH</b> Month 1..12 <b>AccTH:AccT</b> Year
Destroy	None
Time	----
Observations	----
Example	After below one both calls <b>Acc</b> =Day, <b>AccH</b> =Month, <b>AccTH:AccT</b> =Year  rcall _JULIAN_DAY_GET_INIT call _JULIAN_DAY_GET_INIT (chips >=16k)

## Assembler Library 2 – Reference Manual

---

Name	<b>_JULIAN_DAY_SET_GREGORIAN</b>
Function	Set Gregorian date
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	After below one both calls date is assume Gregorian rcall _JULIAN_DAY_SET_GREGORIAN call _JULIAN_DAY_GET_GREGORIAN (chips >= 16k)

Name	<b>_JULIAN_DAY_SET_JULIAN</b>
Function	Set Julian date
Input values	None
Output values	None
Destroy	None
Time	----
Observations	----
Example	After below one both calls date is assume Julian rcall _JULIAN_DAY_SET_JULIAN call _JULIAN_DAY_GET_JULIAN (chips >= 16k)

Name	<b>_JULIAN_DAY_GET_VALUE</b>
Function	Get a pointer of Julian day value in Float Double precision
Input values	None
Output values	Z → Fload Double Value
Destroy	None
Time	----
Observations	The Julian day returned for this function is updated only before calling _JULIAN_DAY_COMPUTE function
Example	After below one both calls date is Z point to Julian day Float Double Value  rcall _JULIAN_DAY_GET_VALUE call _JULIAN_DAY_GET_VALUE (chips >= 16k)

## Assembler Library 2 – Reference Manual

---

Name	<b><code>_JULIAN_DAY_COMPUTE</code></b>
Function	Using actual date compute Julian day
Input values	None
Output values	None
Destroy	Flags, R0..R15
Time	----
Observations	if calling this routine before setting a date and gregorian flag a unpredictable result will be returned
Example	After below one both calls Julian Day has computed.  <code>rcall _JULIAN_DAY_COMPUTE</code> <code>call _JULIAN_DAY_COMPUTE (chips &gt;= 16k)</code>

# Assembler Library 2 – Reference Manual

## COMM - Communications

### I2C (I2C.INC)

#### Description

I2C (Inter-Integrated Circuit) is a multi-master serial computer bus invented by Philips that is used to attach low-speed peripherals to a motherboard, embedded system, or cellphone. The name is pronounced *eye-squared-see* or *eye-two-see*. As of October 1, 2006, no licensing fees are required to implement the I2C protocol. However, fees are still required in order to "officially" allocate I2C slave addresses. This Author drive implement function to implement I2C at any (no mapped) port.

#### Implemented Functions

Name	<b>_I2C_INIT</b>
Function	Initialize I2C Interface
Input values	None
Output values	None
Destroy	----
Time	----
Observations	- Global interrupts are disable during initialization.
Example	<pre>Initialize I2C at PORTB with SCL=0 and SDA=1  .EQU _I2C_PORT_OUT      = PORTB .EQU _I2C_PORT_IN       = PINB .EQU _I2C_PORT_DIR      = DDRB  .EQU _I2C_BIT_SCL       = 0 .EQU _I2C_BIT_SDA       = 1  rcall _I2C_INIT call  _I2C_INIT (Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_I2C_START</b>
Function	Insert I2C start conditions
Input values	None
Output values	None
Destroy	----
Time	----
Observations	----
Example	<pre>rcall _I2C_START call  _I2C_START (Chips &gt;= 16k)</pre>

Name	<b>_I2C_STOP</b>
Function	Insert I2C start conditions
Input values	None
Output values	None
Destroy	----
Time	----
Observations	----
Example	<pre>rcall _I2C_START call  _I2C_STOP (Chips &gt;= 16k)</pre>

Name	<b>_I2C_BIT_OUT</b>
Function	Send Bit thru I2C line
Input values	<b>Cy</b> bit to be send cy=1 to ONE
Output values	None
Destroy	----
Time	----
Observations	Usually this routine is used only by _I2C_BYTE_OUT routine, be carefully when use directly
Example	<pre>Send bit 1  sec rcall _I2C_BIT_OUT call  _I2C_BIT_OUT (Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_I2C_BIT_IN</b>
Function	Get Bit from I2C line
Input values	None
Output values	<b>Cy</b> bit read
Destroy	----
Time	----
Observations	Usually this routine is used only by _I2C_BYTE_IN routine, be carefully when use directly
Example	<pre>rcall _I2C_BIT_IN call  _I2C_BIT_IN (Chips &gt;= 16k)</pre>

Name	<b>_I2C_BYTE_OUT</b>
Function	Send a byte thru I2C line
Input values	<b>Acc</b> Data to be send
Output values	None
Destroy	----
Time	----
Observations	----
Example	<pre>Send data 0xaa to I2C line  Ldi  <b>Acc</b>,0xaa rcall _I2C_DATA_OUT call  _I2C_DATA_OUT (Chips &gt;= 16k)</pre>

Name	<b>_I2C_BYTE_IN</b>
Function	Get a byte from I2C line
Input values	None
Output values	<b>Acc</b> Read Data
Destroy	----
Time	----
Observations	----
Example	<pre>rcall _I2C_DATA_IN call  _I2C_DATA_IN (Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

---

Name	<b>_I2C_ACK_IN</b>
Function	Get a Ack=acknowledgement from I2C line
Input values	None
Output values	<b>Cy</b>
Destroy	----
Time	----
Observations	----
Example	<pre>rcall _I2C_ACK_IN call  _I2C_ACK_IN (Chips &gt;= 16k)</pre>

# Assembler Library 2 – Reference Manual

---

## N64 (N64\_COMM.INC)

### Description

This drive implements N64 Joystick controller of Nintendo corp. Implements routines allow user get all button and Analog Joystick values and states.

### Implemented Functions

Name	<b>_N64_INIT</b>
Function	Initialize _N64 Interface
Input values	None
Output values	None
Destroy	----
Time	----
Observations	<ul style="list-style-type: none"><li>- Global interrupts are disable during initialization.</li><li>- After this initialization DATAINOUT is configured as input to prevent short circuit during initialization.</li></ul>
Example	<pre>Initialize N64 controller at PORTB and Data bit=0  .EQU  _N64_DATAINOUT_OUT      = PORTB .EQU  _N64_DATAINOUT_IN       = PINB .EQU  _N64_DATAINOUT_DIR      = DDRB  .EQU  _N64_BIT_DATAINOUT      = 0  rcall _N64_INIT call  _N64_INIT (Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_N64_STATUS</b>
Function	Update button and joystick coordinates of _N64
Input values	None
Output values	None
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	<pre>rcall _N64_STATUS call  _N64_STATUS (Chips &gt;= 16k)</pre>

Name	<b>_N64_GET_A</b>
Function	Get key states
Input values	<b>Acc</b> Key Code
Output values	<b>Acc</b> _ON=pressed or _OFF=released
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	<pre>Read status of button Z  Ldi <b>Acc</b>,_N64_KEY_A rcall _N64_GET_A call  _N64_GET_A (Chips &gt;= 16k)</pre>

Name	<b>_N64_GET_X</b>
Function	Get joystick X coordinate
Input values	<b>None</b>
Output values	<b>Acc</b> X coordinate
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	<pre>rcall _N64_GET_X call  _N64_GET_X (Chips &gt;= 16k)</pre>

Name	<b>_N64_GET_Y</b>
Function	Get joystick Y coordinate
Input values	<b>None</b>
Output values	<b>Acc</b> Y coordinate
Destroy	<b>Flags</b>
Time	----
Observations	----
Example	<pre>rcall _N64_GET_Y call  _N64_GET_Y (Chips &gt;= 16k)</pre>

# Assembler Library 2 – Reference Manual

## SLIP (SLIP.INC)

### Description

The TCP/IP protocol family runs over a variety of network media: IEEE 802.3 (ethernet) and 802.5 (token ring) LAN's, X.25 lines, satellite links, and serial lines. There are standard encapsulations for IP packets defined for many of these networks, but there is no standard for serial lines. SLIP, Serial Line IP, is a currently a de facto standard, commonly used for point-to-point serial connections running TCP/IP. It is not an Internet standard. More details see RFC 1055.

#### SLIP EXAMPLE

Fortunately, one of the TCP/IP families of standards, SLIP, provides exactly this functionality. It uses simple escape codes inserted in the serial data stream to signal block boundaries as follows.

- The end of each block is signaled by a special End byte, with a value of 0xC0.
- If a data byte equal 0XC0, two bytes with the values 0xDB,0xDC are sent instead.
- if a data byte equal 0xDB, two bytes with the values 0xDB,0xDD are sent instead.

Additionally, most implementation send the End byte at the beginning of each block to clear out garbage characters prior to starting the new message.

#### SLIP FRAME

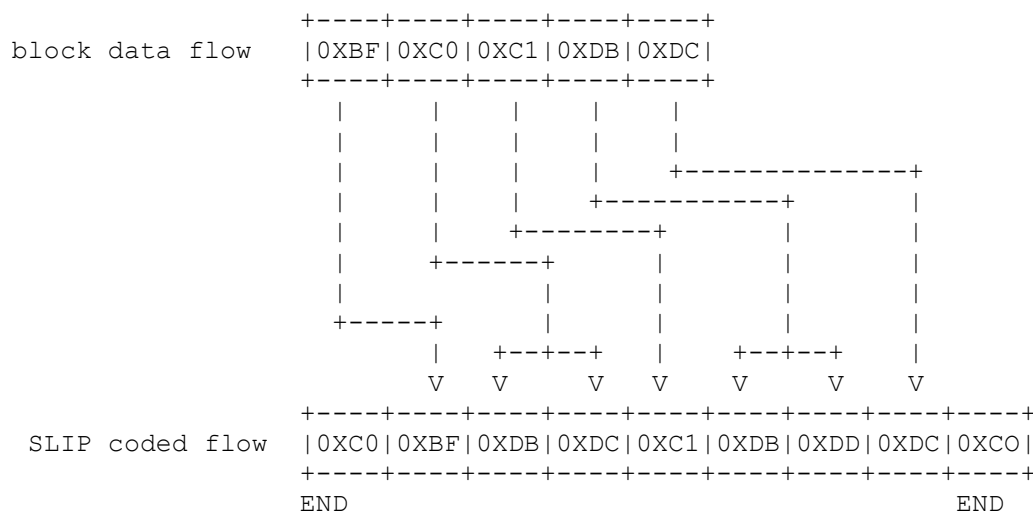

END	DATA	END
0XC0	1-1006 BYTES	0XC0

There is effectively no limit to the size of the data block, but you have to decide on some value in order to dimension the data buffers. With old, slow serial links, a maximum size of 256 bytes was generally used, but you'll be using faster links, and a larger size is better for minimizing protocol overhead. By convention, 1006 bytes is often used.

The encoding method can best be illustrated by an example. Assume a six-byte block of data with the hex values BF C0 C1 DB DC is sent; it is expanded to C0 BF DB DC C1 DB DD DC C0.

# Assembler Library 2 – Reference Manual

## SLIP TRANSMISSION SAMPLE

## SLIP OBSERVATION

When connect SLIP device in serial port under WINDOWS, it send a ATE1<cr> modem command and device replay OK<cr><lf>, after this the OS send DSVP packed to inform device about OS resorces, device replay OK<cr><lf> again, after this OS send a SLIP protocol with TCP/IP.

## Connections

## MODEM for SLIP protocol

# Generic serial DEVICE for SLIP protocol

CTS, RTS, DCD from PC side are connected together

## Implemented Functions

## Assembler Library 2 – Reference Manual

Sample code of **SLIP** Initialization sequence.

```
ldiaw    RX_BUFFER_SIZE          ;rx buffer size
ldiw     Z,RX_BUFFER_PTR         ;rx pointer
RCALL    _SLIP_SET_RX_BUFFER     ;set
ldiaw    TX_BUFFER_SIZE          ;tx buffer size
ldiw     Z,RX_BUFFER_PTR         ;tx pointer
RCALL    _SLIP_SET_TX_BUFFER     ;set
ldiw     Z,RX_FUNC_ADDR          ;set function rx address
RCALL    _SLIP_SET_RX_ADDR      ;set
ldiw     Z,TX_FUNC_ADDR          ;set function tx address
RCALL    SLIP_SET_TX_ADDR
ldiw     Z,TIMEOUT_FUNC_ADDR     ;set timeout function
ldiaw    100                     ;set timeout to 100ms
RCALL    _SLIP_SET_TIMEOUT_ADDR
```

Name	<b>_SLIP_SET_RX_BUFFER</b>
Function	Set address of receiver data buffer and size
Input values	<b>AccH:Acc</b> size <b>Z-&gt;</b> data buffer
Output values	None
Destroy	----
Time	----
Observations	----
Example	Set SLIP receiver data buffer address and size Ldiaw SLIP_SIZE Ldiw Z,SLIP_BUFFER rcall _SLIP_SET_RX_BUFFER call _SLIP_SET_RX_BUFFER(Chips >= 16k)

Name	<b>_SLIP_GET_RX_BUFFER</b>
Function	Get address of receiver data buffer and size
Input values	None
Output values	<b>AccH:Acc</b> size <b>Z-&gt;</b> data buffer
Destroy	----
Time	----
Observations	----
Example	rcall _SLIP_GET_RX_BUFFER call _SLIP_GET_RX_BUFFER(Chips >= 16k)

## Assembler Library 2 – Reference Manual

Name	<b>_SLIP_SET_TX_BUFFER</b>
Function	Set address of transmitter data buffer and size
Input values	<b>AccH:Acc</b> size <b>Z-&gt;</b> data buffer
Output values	None
Destroy	----
Time	----
Observations	----
Example	Set SLIP transmitter data buffer address and size Ldiaw SLIP_SIZE Ldiw Z,SLIP_BUFFER rcall _SLIP_SET_TX_BUFFER call _SLIP_SET_TX_BUFFER(Chips >= 16k)

Name	<b>_SLIP_GET_TX_BUFFER</b>
Function	Get address of transmitter data buffer and size
Input values	None
Output values	<b>AccH:Acc</b> size <b>Z-&gt;</b> data buffer
Destroy	----
Time	----
Observations	----
Example	rcall _SLIP_GET_TX_BUFFER call _SLIP_GET_TX_BUFFER(Chips >= 16k)

Name	<b>_SLIP_SET_RX_ADDRESS</b>
Function	Set address of routine that receiver data
Input values	<b>Z</b> address
Output values	None
Destroy	----
Time	----
Observations	----
Example	Set SLIP receiver address to RX_FUNCTION  Ldiw Z,RX_FUNCTION rcall _SLIP_SET_RX_ADDRESS call _SLIP_SET_RX_ADDRESS(Chips >= 16k)

## Assembler Library 2 – Reference Manual

Name	<b>_SLIP_SET_TX_ADDRESS</b>
Function	Set address of routine that transmit data
Input values	<b>Z</b> address
Output values	None
Destroy	----
Time	----
Observations	----
Example	Set SLIP transmit address to TX_FUNCTION  Ldiw Z,TX_FUNCTION rcall _SLIP_SET_TX_ADDRESS call _SLIP_SET_TX_ADDRESS(Chips >= 16k)

Name	<b>_SLIP_SET_TIMEOUT_ADDRESS</b>
Function	Set address of routine that set timeout value for received data
Input values	<b>Z</b> address
Output values	None
Destroy	----
Time	----
Observations	----
Example	Set SLIP timeout receiver address to TIMOUT_FUNCTION  Ldiw Z,TIMOUT_FUNCTION rcall _SLIP_SET_TIMEOUT_ADDRESS call _SLIP_SET_TIMEOUT_ADDRESS(Chips >= 16k)

Name	<b>_SLIP_SET_INDEX</b>
Function	Set Data buffer index
Input values	<b>AccH:Acc</b> data index <b>Cy=1</b> if data>SLIP Buffer size
Output values	None
Destroy	----
Time	----
Observations	----
Example	Set SLIP index to get 3 <sup>rd</sup> data  Ldiaw 2 rcall _SLIP_SET_INDEX call _SLIP_SET_INDEX(Chips >= 16k)

## Assembler Library 2 – Reference Manual

Name	<b>_SLIP_GET_INDEX</b>
Function	Get Data buffer index
Input values	None
Output values	<b>AccH:Acc</b> data index
Destroy	----
Time	----
Observations	----
Example	rcall _SLIP_GET_INDEX call _SLIP_GET_INDEX(Chips >= 16k)

Name	<b>_SLIP_GET_DATA</b>
Function	Get Data from receiver buffer
Input values	None
Output values	<b>Acc</b> data
Destroy	----
Time	----
Observations	----
Example	rcall _SLIP_GET_DATA call _SLIP_GET_DATA(Chips >= 16k)

Name	<b>_SLIP_POLLING</b>
Function	Polling a serial line and waiting CODE_END
Input values	None
Output values	<b>Acc</b> =SLIP_MSG_OK, <b>cy</b> =0 if SLIP block received ok <b>Acc</b> =SLIP_MSG_POL_END, <b>cy</b> =1 SLIP packet not received <b>Acc</b> =SLIP_MSG_TIMEOUT, <b>cy</b> =1 if timeout occur <b>Acc</b> =SLIP_MSG_UNEXPECTED, expected ESC_END, but received other code <b>AccTH:AccT</b> total received bytes if _OK <b>AccTH:AccT</b> total received bytes until Error if _NOTOK
Destroy	----
Time	----
Observations	----

## Assembler Library 2 – Reference Manual

Name	<b>_SLIP_SEND</b>
Function	Transmitting Data using SLIP protocol
Input values	None
Output values	None
Destroy	----
Time	----
Observations	call _SLIP_SET_TX_BUFFER before to set address of data
Example	rcall _SLIP_SEND call _SLIP_SEND(Chips >= 16k)

<b>_SLIP Constants</b>	
Name	Value
_SLIP_CODE_END	0XC0
_SLIP_CODE_ESC	0XDB
_SLIP_CODE_ESC_END	0XDC
_SLIP_CODE_ESC_ESC	0XDD
_SLIP_CODE_OK	1
_SLIP_CODE_POL_END	2
_SLIP_CODE_TIMEOUT	3
_SLIP_CODE_UNEXPECTED	4

**SERIAL**

## TWO WIRE

*DT COMM V1 (DT COMM V1.INC)*

DTCOMMV1 is a Author proprietary protocol that allow faster communication unilateral from Master to slave using only one wire where master always request transmission and slave return data according below flow chart, maximum rate obtained is about 125Kbits.

Name	<u>_DTCOMMV1_SLAVE_INIT</u>
Function	Initialize DTCOMMV1 like a Slave interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	<ul style="list-style-type: none"> <li>- Global interrupts are disabled</li> <li>- Use External 0 interrupt handle <u>_HDC_INT0_VECT</u></li> </ul>
Example	<pre>rcall _DTCOMMV1_SLAVE_INIT call  DTCOMMV1_SLAVE_INIT(Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_DTCOMMV1_MASTER_INIT</b>
Function	Initialize DTCOMMV1 like a Master interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disabled
Example	<pre>Initialize master in PORTD Data bit=2  .EQU _DTCOMMV1_PORT_OUTPUT    = PORTD .EQU _DTCOMMV1_PORT_DIR       = DDRD .EQU _DTCOMMV1_PORT_INPUT     = PIND  .EQU _DTCOMMV1_DATA_BIT       = 2  rcall _DTCOMMV1_SLAVE_INIT call  _DTCOMMV1_SLAVE_INIT(Chips &gt;= 16k)</pre>

Name	<b>_DTCOMMV1_GET_DATA</b>
Function	Get data from Slave
Input values	None
Output values	<b>AccH:Acc</b> Data
Destroy	None
Time	----
Observations	Call _DTCOMMV1_REQUEST Before to check if new data arrived
Example	<pre>rcall _DTCOMMV1_GET_DATA call  _DTCOMMV1_GET_DATA(Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

### SOFTWARE (SOFTWARE SERIAL.INC)

#### Description

Software serial communication that allow use any port (not mapped) in any bit, this version work only 8 data bits 115200 bauds and 2 stop bits optimized to use 16Mhz crystal.

Name	<code>_SCOMM_INIT</code>
Function	Initialize SCOMM interface
Input values	None
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disabled during initialization
Example	<pre>Initialize SCOMM ports with Data Port as PORTA and control port as PORTC, TX bit=0, RX bit=1, RTS bit=2 CTS bit=3  .EQU _SCOMM_PORT_DATA_OUTPUT=PORTA .EQU _SCOMM_PORT_DATA_DIR    =DDRA .EQU _SCOMM_PORT_DATA_INPUT =PINA  .EQU _SCOMM_PORT_CTRL_OUTPUT=PORTC .EQU _SCOMM_PORT_CTRL_DIR    =DDRC .EQU _SCOMM_PORT_CTRL_INPUT =PINC  .EQU _SCOMM_TX_BIT   = 0 .EQU _SCOMM_RX_BIT   = 1 .EQU _SCOMM_RTS_BIT  = 2 .EQU _SCOMM_CTS_BIT  = 3  rcall _SCOMM_INIT call  _SCOMM_INIT(Chips &gt;= 16k)</pre>

## Assembler Library 2 – Reference Manual

Name	<b>_SCOMM_TX</b>
Function	Send data to Serial Line
Input values	Acc Data to be send
Output values	None
Destroy	None
Time	----
Observations	- Global interrupts are disabled during Transmission
Example	Send 0x27 to serial line  Ldi <b>Acc</b> ,0x27 rcall _SCOMM_TX call _SCOMM_TX(Chips >= 16k)

Name	<b>_SCOMM_RX</b>
Function	Get data to Serial Line
Input values	None
Output values	<b>Acc</b> Data received if cy=0 <b>Acc</b> Error Code if cy=1
Destroy	None
Time	----
Observations	- This routine use a fixed timeout of approximately 0.5 seconds elapsed this time <b>cy</b> =1 means timeout error
Example	rcall _SCOMM_RX call _SCOMM_RX(Chips >= 16k)

Name	<b>_SCOMM_GET_RTS</b>
Function	Get RTS state
Input values	None
Output values	<b>Cy</b> =1 if RTS=high level
Destroy	None
Time	----
Observations	----
Example	rcall _SCOMM_GET_RTS call _SCOMM_GET_RTS(Chips >= 16k)

## Assembler Library 2 – Reference Manual

Name	<b>_SCOMM_SET_CTS</b>
Function	Set CTS state
Input values	CY=1 if to put CTS=HIGH
Output values	<b>None</b>
Destroy	None
Time	----
Observations	----
Example	<pre>Set CTS=low  clc rcall _SCOMM_SET_CTS call _SCOMM_SET_CTS (Chips &gt;= 16k)</pre>
